# UTAH'S FINE PARTICULATE AIR POLLUTION PROBLEM

Arnold W. Reitze, Jr.\*

## *Abstract*

*For those living along Utah's Wasatch Front, the air quality problem is visibly obvious. The air pollution, especially in the winter when inversions trap pollutants between the surrounding mountains, is hazardous to people's health. Several counties along the Wasatch Front violate the Clean Air Act's air quality standard for particulate matter and are currently designated as "nonattainment" areas. The Environmental Protection Agency requires that affected areas take action to reduce the levels of pollution. This Article will discuss the Clean Air Act and the state's role in ensuring compliance. This Article then examines some of the reasons for the Wasatch Front's poor air quality. Finally, this Article proposes solutions and identifies issues that demand further study in order to combat the area's air pollution problem.*

## I. INTRODUCTION

In 1970, the Clean Air Act (CAA) Amendments authorized the administrator of the Environmental Protection Agency (EPA) to promulgate primary and secondary National Ambient Air Quality Standards (NAAQS).<sup>1</sup> Primary standards are to protect the public health; secondary standards are to protect public welfare.<sup>2</sup>

The EPA subsequently promulgated NAAQS at 40 C.F.R. §§ 50.4–50.12 for six ambient air pollutants—called “criteria pollutants”<sup>3</sup>—pursuant to CAA § 109.<sup>4</sup> The original criteria pollutants were particulate matter (PM), sulfur dioxide (SO<sub>2</sub>), nitrogen dioxide (NO<sub>2</sub>), carbon monoxide (CO), photochemical oxidants (now ozone (O<sub>3</sub>)), and hydrocarbons.<sup>5</sup> However, the 1971 hydrocarbon regulation<sup>6</sup> was

<sup>5</sup> *Six Common Air Pollutants*, *supra* note 3.

revoked in 1983,<sup>7</sup> and lead was added in 1978.<sup>8</sup> In spite of the deregulation of hydrocarbons, the EPA does continue to regulate emissions of volatile organic compounds (VOCs) (a subset of hydrocarbons) because they can trigger ozone formation or transform into particulate matter.<sup>9</sup> Most primary standards were to be met by May 31, 1975, while secondary standards were to be achieved within a reasonable time,<sup>10</sup> although, except for SO<sub>2</sub>, secondary standards are the same as primary standards.<sup>11</sup>

The criteria pollutant of primary concern in the Salt Lake area is particulate matter. The NAAQS for particulate matter, expressed in terms of total suspended particulates (TSP), were promulgated in 1971.<sup>12</sup> In 1987, the EPA changed the particulate standard to regulate only particulate matter with an aerodynamic diameter of 10 micrometers or smaller (PM<sub>10</sub>).<sup>13</sup> On October 17, 1997, the EPA established an additional PM<sub>2.5</sub> NAAQS to regulate particles less than or equal to 2.5 micrometers.<sup>14</sup> The PM<sub>2.5</sub> annual standard was set at 15 µg/m<sup>3</sup>, based on the annual three-year average of PM<sub>2.5</sub> concentrations and a twenty-four-hour PM<sub>2.5</sub> standard of 65 µg/m<sup>3</sup>, which is based on a three-year average of the ninety-eighth percentile of the twenty-four-hour PM<sub>2.5</sub> concentrations at each monitoring site within a geographic area.<sup>15</sup> Thus, an area must be below 65 µg/m<sup>3</sup> for 358 days per year or it violates the short-term standard. The twenty-four-hour PM<sub>10</sub> standard was also revised to 150 µg/m<sup>3</sup> using the ninety-ninth percentile of the twenty-four-hour PM<sub>10</sub> concentration at each monitor within an area.<sup>16</sup> The secondary standards were revised to make them identical to the new primary standards.<sup>17</sup>

<sup>16</sup> National Ambient Air Quality Standards for Particulate Matter, 62 Fed. Reg. at 38,679.

<sup>17</sup> *Id.* at 38,652.

The EPA continued to use the 1997 PM<sub>10</sub> standard with a new statistical approach as an indicator of PM less than or equal to 2.5 µg.<sup>18</sup> This part of the 1997 rule was vacated by the D.C. Circuit in 1999.<sup>19</sup> The EPA subsequently removed the vacated portion of the 1997 PM<sub>10</sub> standard from the Code of Federal Regulations.<sup>20</sup>

On October 17, 2006, the EPA's 1997 PM<sub>2.5</sub> standard became more stringent.<sup>21</sup> The annual average was left at 15µg/m<sup>3</sup> but the twenty-four-hour standard was lowered from 65µg/m<sup>3</sup> to 35 µg/m<sup>3</sup> based on the ninety-eighth percentile concentration.<sup>22</sup> The Agency revoked the primary PM<sub>10</sub> annual standard. The twenty-four-hour PM<sub>10</sub> standard of 150 µg/m<sup>3</sup> was not changed from the 1997 NAAQS revision.<sup>23</sup> On February 24, 2009, the D.C. Circuit upheld the revocation of the annual PM<sub>10</sub> standard and approved the twenty-four-hour standard; but the court remanded the annual fine particulate standard because the EPA failed to adequately explain why the 15 µg/m<sup>3</sup> standard for PM<sub>2.5</sub> is sufficient to protect public health with an adequate margin of safety while providing an adequate margin of safety from the risk of short-term exposure and from morbidity affecting vulnerable subpopulations.<sup>24</sup> The court also remanded the secondary NAAQS for fine PM because the EPA unreasonably concluded the NAAQS were adequate to protect public welfare from adverse effects on visibility.<sup>25</sup>

On January 15, 2013, the EPA promulgated revised PM NAAQS. The primary annual PM<sub>2.5</sub> primary standard was lowered to 12 µg/m<sup>3</sup>; the twenty-four-hour PM<sub>2.5</sub> standard of 35 µg/m<sup>3</sup>, the twenty-four-hour PM<sub>10</sub> primary standards; and the secondary standards were not changed.<sup>26</sup> The EPA's 2013 PM<sub>2.5</sub> regulations were challenged in the D.C. Circuit in *National Association of Manufacturers, et al. v. EPA*.<sup>27</sup> The industry petitioners claimed the regulations are more stringent than is needed to protect public health and the mandated monitoring overstates the

#### A. Nonattainment Areas

To achieve the goals of the NAAQS, each state must develop a state implementation plan (SIP). But before a state can develop its SIP, it must determine which areas within its boundaries do not comply with the NAAQS because the stringency of the CAA's requirements are based on the quality of an area's ambient air.<sup>30</sup> CAA section 107(d) requires the EPA to designate areas as "attainment," "nonattainment," or "unclassifiable," depending on their compliance with the relevant NAAQS.<sup>31</sup> A nonattainment area is designated if the NAAQS are exceeded or the area contributes to NAAQS violations in a nearby area.<sup>32</sup> An "unclassifiable" area is one with data that is inadequate to allow a determination to be made.<sup>33</sup> In nonattainment areas, states must implement controls that will achieve attainment "as expeditiously as practicable."<sup>34</sup>

In April 2003, the EPA issued a guidance document, known as the Holmstead Memo, initiating the PM<sub>2.5</sub> designation process.<sup>35</sup> The memo says that if any area within a metropolitan area exceeds the annual PM<sub>2.5</sub> NAAQS, then all areas within the metropolitan area are presumed to contribute to that violation and warrant nonattainment designations.<sup>36</sup> However, the EPA may designate urban nonattainment areas as areas larger or smaller than the Office of Management and

<sup>35</sup> Memorandum from Jeffrey R. Holmstead, Assistant Administrator, EPA for Air & Radiation, to Regional Administrators, Regions I–X (Apr. 1, 2003), available at [http://www.epa.gov/airquality/particlepollution/designations/1997standards/documents/pm25\\_desig\\_guidance\\_final.pdf](http://www.epa.gov/airquality/particlepollution/designations/1997standards/documents/pm25_desig_guidance_final.pdf), archived at <http://perma.cc/92TS-S5L2>.

<sup>36</sup> The Holmstead Memo lists nine factors to guide that case-by-case analysis: (1) emissions in the potentially contributing areas; (2) air quality in those areas; (3) population density and degree of urbanization in those areas; (4) traffic and commuting patterns; (5) expected growth; (6) meteorology; (7) geography and topography; (8) jurisdictional boundaries; and (9) level of control of emissions sources. *Id.* at 7. The memo encourages states submitting designations that depart from the metropolitan presumption to justify such designations by reference to all nine factors. *Id.*

Budget (OMB)-defined metropolitan area.<sup>37</sup> The EPA promulgated the PM<sub>2.5</sub> designations for the nation on January 5, 2005.<sup>38</sup>

### B. Utah's Air Quality Status

Salt Lake and Utah Counties are nonattainment areas for PM<sub>10</sub>. Salt Lake and eastern Tooele counties are nonattainment areas for sulfur dioxide. Salt Lake and Davis counties are maintenance areas for ozone.<sup>39</sup> Counties in northeastern Utah, however, may soon be designated as nonattainment areas for ozone because of the emissions from expanded oil and gas operations.<sup>40</sup> Utah's major problem is the failure to meet the short-term PM<sub>2.5</sub> NAAQS along the Wasatch Front and Cache Valley. Utah's Division of Air Quality (DAQ) has created three twenty-four-hour PM<sub>2.5</sub> nonattainment areas: Cache Valley, which includes Cache and Utah counties, and Franklin County, Idaho; Provo, which includes Utah County; and Salt Lake, which includes Salt Lake and Davis counties and parts of Weber, Box Elder, and Tooele counties.<sup>41</sup>

Utah submitted its proposed PM<sub>2.5</sub> designations for the Salt Lake nonattainment area on December 18, 2007, which included recommendations that Box Elder County, to the north of the Great Salt Lake, be designated as an attainment area and Tooele County, to the west of Salt Lake County, be designated as unclassifiable.<sup>42</sup> The EPA, however, determined that portions of Box Elder and Tooele counties are nonattainment areas because emissions contribute to nearby violations of the PM<sub>2.5</sub> standard in the greater Salt Lake City area.<sup>43</sup> Based on its

<sup>43</sup> U.S. ENVTL. PROTECTION AGENCY, UTAH AND UTAH/IDAHO AREA DESIGNATIONS FOR THE 24-HOUR FINE PARTICLE NATIONAL AMBIENT AIR QUALITY STANDARDS 53, available at [http://www.epa.gov/pmdesignations/2006standards/final/TSD/tsd\\_4.0\\_4.8\\_4.8](http://www.epa.gov/pmdesignations/2006standards/final/TSD/tsd_4.0_4.8_4.8)

analysis, the EPA defined the boundaries of the air shed as the Wasatch Mountains to the east, the Promontory and North Promontory Mountains to the west (for eastern Box Elder County), and the Stansbury Mountains to the west (for eastern Tooele County).<sup>44</sup>

The EPA designated the Salt Lake area as a nonattainment area for the PM<sub>2.5</sub> twenty-four-hour NAAQS in 2009 and identified the boundaries of the nonattainment area.<sup>45</sup> However, there is no violation of the 2006 annual PM<sub>2.5</sub> standard or the more stringent 2013 annual PM<sub>2.5</sub> standard of 12 µg/m<sup>3</sup>.<sup>46</sup> The controversy over the area included in the nonattainment designation for the PM<sub>2.5</sub> twenty-four-hour NAAQS led to litigation. On February 24, 2012, the D.C. Circuit upheld the Agency's decision to designate the eastern portions of both Box Elder County and Tooele County as a nonattainment area because they contributed to nearby violations of the twenty-four-hour PM<sub>2.5</sub> standard in and around Salt Lake City.<sup>47</sup> This decision was consistent with the court's earlier decision upholding the EPA's designation process in *Catawba County, North Carolina v. EPA*.<sup>48</sup>

The Salt Lake City area's topography and meteorology play a significant role in its PM<sub>2.5</sub> problem. The area is a valley almost completely bounded by mountain ranges. Under normal meteorological conditions, air temperature decreases as altitude increases. In the Salt Lake City area, wintertime high-pressure systems cause temperature inversions, and high-altitude warm air traps cold air below, with an inversion layer at about 1,500 feet. The surrounding mountains, which extend above the inversion layer, trap the ground level cold air and prevent dispersion. Pollution then accumulates in the stagnant air mass, sometimes for weeks at a time. The air quality worsens gradually until the high-pressure system lifts, at which point the polluted air can disperse over the mountains.<sup>49</sup>

Because the Salt Lake area's air quality fails to meet EPA standards for fine particulates (PM<sub>2.5</sub>), Utah must revise its SIP for the three nonattainment areas to reduce emissions of PM<sub>2.5</sub> and other gaseous pollutants that are converted to PM<sub>2.5</sub> in the atmosphere. During the winter inversions, most of the PM<sub>2.5</sub> comes from

<sup>49</sup> *ATK Launch Sys.*, 669 F.3d at 335.

secondary emissions. The mean contributions to PM<sub>2.5</sub> are nitrate, 41%; organic mass, 19%; ammonium, 17%; sulfate, 6%; crustal material, 3%; elemental carbon, 3%; and all other substances, 11%.<sup>50</sup> Directly emitted PM<sub>2.5</sub> is important because these emissions have a linear relation to atmospheric concentrations.<sup>51</sup> Secondary emissions do not have the same potential to promote PM<sub>2.5</sub> formation, but the quantity emitted makes secondary emissions, such as volatile organic compounds (VOCs) and nitrogen oxides (NO<sub>x</sub>), important contributors to high PM<sub>2.5</sub> concentrations. Sulfur oxides (SO<sub>x</sub>) also are secondary contributors to PM<sub>2.5</sub> formation. Moreover, ammonium nitrate may be a factor in the area's air pollution problem because ammonia emissions react with nitric acid formed from NO<sub>x</sub> to form this particulate.<sup>52</sup> However, Utah's DAQ takes the position that controlling ammonia emissions will have little or no effect on PM<sub>2.5</sub> concentrations,<sup>53</sup> but research on the role of ammonia continues.

### C. State Implementation Plans

The CAA's sections 107 and 110 require each state to develop a SIP to bring nonattainment areas into compliance with the NAAQS and to prevent deterioration of ambient air quality in areas that meet the NAAQS (a.k.a. prevention of significant deterioration (PSD) areas).<sup>54</sup> The SIP process begins with an emissions inventory of air pollution sources. Emission requirements in the CAA that are imposed by the federal government are usually incorporated by reference into the Utah regulations and become part of the inventory process.<sup>55</sup> The state then uses mathematical models to determine the number of tons of the various pollutants that must be eliminated in order to attain the NAAQS for each criteria pollutant. Plans are then developed to allocate the needed reductions to transportation and stationary point sources as well as area source categories, which results in each source category being assigned an emissions budget. The emissions budget for source categories is then used to impose limits on emissions from specific sources in the nonattainment area.

In nonattainment areas, each nonattainment plan is to provide for the implementation of reasonably available control measures (RACM), and existing stationary sources are subject to a subset of RACM, which is reasonably available

<sup>53</sup> UTAH PM<sub>2.5</sub> SIP, *supra* note 46, at 14.

<sup>54</sup> Clean Air Act §§ 107, 110, 42 U.S.C. §§ 7407, 7410 (2012).

<sup>55</sup> See e.g., UTAH ADMIN. CODE r. 307-110-10, -17 (2014).

control technology (RACT).<sup>56</sup> Implementing RACT requires identification of potential measures that are reasonable; modeling to determine an attainment date that is as expeditious as practicable; and selection of a RACT technology that is technologically and economically feasible.<sup>57</sup> The EPA's review of Utah's SIP modifications included criticism of the state for allowing major polluters to do their own RACT analysis.<sup>58</sup>

Section 110 delegates to the states the responsibility to determine which sources are regulated and to what extent.<sup>59</sup> A state's SIP may include programs that are economically or technologically infeasible; the CAA gives the EPA no authority to question the wisdom of a state's choice.<sup>60</sup> The federal government, however, plays an important role because it regulates emissions from new stationary sources,<sup>61</sup> major sources of hazardous air pollutants,<sup>62</sup> and new motor vehicles and engines.<sup>63</sup> Moreover, the federal government administers a complex preconstruction permit program for new or modified major stationary sources, although the program may be delegated to the states.<sup>64</sup>

The United States is divided into air quality control regions (AQCRs), and they are divided into compliance and nonattainment areas for each criteria pollutant. Nonattainment areas for some criteria pollutants are further classified according to the severity of pollution. Nonattainment areas for PM<sub>10</sub>, for example, are classified as moderate or serious.<sup>65</sup> After a new or revised NAAQS is promulgated, states must submit the air quality classification for all areas within their borders to the EPA.<sup>66</sup> The EPA must then approve the submitted designations or take prescribed steps to modify the submission.<sup>67</sup>

In Utah, SIP development is the responsibility of the DAQ.<sup>68</sup> After the DAQ completes a SIP revision it is submitted to the EPA, which is required to review

<sup>68</sup> *See Utah Air Quality Board*, UTAH DEP'T ENVTL. QUALITY, <http://www.deq.utah.gov/boards/airquality/index.htm>, archived at <http://perma.cc/EJZ7-2UZH> (last visited Nov. 12, 2014). The DAQ had a fiscal year 2012 budget of \$12,033,600, which includes \$4,273,600 of federal funds. UTAH GOVERNOR'S OFFICE OF PLANNING & BUDGET, BUDGET

each SIP and fully approve the plan, partially approve and partially disapprove the plan, conditionally approve the plan, or reject the plan.<sup>69</sup> The EPA's role is limited to the ministerial function of reviewing a SIP for consistency with the Act's requirements.<sup>70</sup> The EPA must disapprove a state proposed SIP if it would interfere with the state's attainment and maintenance of the NAAQS.<sup>71</sup>

On November 21, 2013, the EPA proposed a revised implementation rule for PM<sub>2.5</sub> in response to the D.C. Circuit remand in January 2013.<sup>72</sup> The proposed rule gives states until December 31, 2014, to submit SIP revisions, if needed, to comply with 40 C.F.R. Part 51 to include the need to satisfy the requirements of CAA Part 1, Subpart 4.<sup>73</sup> Environmentalists are claiming the proposed rule is too weak.<sup>74</sup> On October 25, 2013, the EPA promulgated a final rule partially approving and partially disapproving Utah's SIP submission needed to comply with the PM<sub>2.5</sub> NAAQS of July 18, 1997, and October 17, 2006.<sup>75</sup> This required Utah's DAQ to revise its proposed SIP revisions, and on December 4, 2013, it adopted another SIP revision.<sup>76</sup> Utah's PM<sub>2.5</sub> SIP revision was approved by Utah's Air Quality Board on January 8, 2014, although it appears to be unacceptable to the EPA.<sup>77</sup>

## II. CONTROLLING EMISSION SOURCES

Meeting SIP requirements to improve atmospheric concentrations of criteria pollutants ultimately is dependent on controlling emissions from sources.<sup>78</sup> The Salt Lake nonattainment area needs to reduce PM<sub>2.5</sub> emissions by 123.05 tons per day (t/d) from 2008 emissions of 365.96 t/d; Cache County needs a reduction of 5.94 t/d from 2008 emissions of 26.7 t/d; and Utah County needs a reduction of 29.07 t/d from its 2008 emissions of 83.19 t/d.<sup>79</sup>

### A. Mobile Sources

Utah's DAQ reports that about half the PM<sub>2.5</sub> air pollution in the Salt Lake area is from mobile road sources.<sup>80</sup> Mobile source emissions are controlled almost entirely by the federal government, which means the emissions reductions in the SIP are dominated by mandatory reductions imposed by the EPA's regulation of the automotive industry.<sup>81</sup> Since 1970, the EPA's regulatory program has dramatically reduced new motor vehicle emissions.<sup>82</sup>

For the Salt Lake City nonattainment area, winter PM<sub>2.5</sub> the DAQ projects an 11.9% reduction by 2019 from the 2010 base year, but 76.5% of this reduction is to come from road and nonroad mobile sources.<sup>83</sup> NO<sub>x</sub> is to be reduced 29.9%, but the reductions from road and nonroad mobile sources exceeds the overall reduction; VOC is to be reduced 34.3%, with 74.2% of the reduction projected to come from road and nonroad mobile sources.<sup>84</sup> Utah's DAQ is depending on federally mandated emission reductions from current and future motor vehicles to lower emissions from mobile road sources in the Salt Lake nonattainment area, which will minimize the reductions needed from stationary sources that are Utah's responsibility.<sup>85</sup> Moreover, the emissions inventory is a critical factor in

<sup>83</sup> See UTAH PM<sub>2.5</sub> SIP, *supra* note 46, at 26.

<sup>84</sup> *Id.*

<sup>85</sup> The most important new regulation is the Tier 3 regulations announced by the EPA on March 3, 2014. See U.S. ENVTL. PROTECTION AGENCY, EPA SETS TIER 3 MOTOR VEHICLE EMISSION AND FUEL STANDARDS 1–2 (2014), available at <http://www.epa.gov/otaq/documents/tier3/420f14009.pdf>, archived at <http://perma.cc/C6G2-F9PP>.

determining the stringency of the SIP-based requirements. The lower the percentage of total emissions from area and point sources, the less control Utah's DAQ will need to impose.

### *B. Area Sources*

Air pollution is categorized based on its source. In Utah, stationary sources that exceed an emissions threshold, commonly one hundred tons per year of a pollutant, are considered major sources. Sources below the threshold are considered area sources and are subject to less stringent regulation.<sup>86</sup> Major sources are also known as point sources.<sup>87</sup> Area sources in the Salt Lake area are the second most important source of emissions with 25.6% of the PM<sub>2.5</sub>, 35.6% of the VOCs, and 12.9% of the NO<sub>x</sub> in the winter of 2014.<sup>88</sup> Utah's DAQ lists twenty-two categories of area sources.<sup>89</sup> The Salt Lake nonattainment area's area sources have higher PM<sub>2.5</sub> emissions and much higher emissions of VOCs than point sources, but NO<sub>x</sub> emissions from area sources are 13.72% lower than from point sources in the 2010 base year.<sup>90</sup> VOCs are an important pollutant emitted by area sources because they account for more than one-third of the Salt Lake Area's emissions of this pollutant, which can transform into PM. The six most significant area source categories are solid fuel burning, architectural coatings, degreasing, consumer products, metal parts coating, and auto body refinishing, and they account for 81.8% of the Salt Lake area's VOC emissions.<sup>91</sup> Utah's DAQ SIP revision projects that area sources will decrease VOC emissions in 2019 from the 2010 base by 28.0%; NO<sub>x</sub> emissions will essentially be unchanged; and PM<sub>2.5</sub> emissions will decrease by 23.5%.<sup>92</sup>

Area sources are controlled by requirements applicable to specific industrial classifications. For example, wood manufacturers and graphic arts businesses are subject to control technologies or management practices appropriate to their classification.<sup>93</sup> Area sources have been subject to controls since 1981 and controls often are based on the EPA's control technique guidelines (CTGs) that have been adopted into Utah's air quality rules.<sup>94</sup> Utah adopted twenty-three new rules in 2013 for area sources in the Salt Lake nonattainment area, and most became effective by January 1, 2014.<sup>95</sup> The DAQ expects these new rules to impose costs

<sup>89</sup> *Id.* at 57.

<sup>90</sup> *Id.* at 26.

<sup>91</sup> See *id.* at 25, 57.

<sup>92</sup> *Id.* at 26.

<sup>93</sup> UTAH ADMIN. CODE r. 307-343, -351 (2014).

<sup>94</sup> UTAH PM<sub>2.5</sub> SIP, *supra* note 46, at 44.

<sup>95</sup> *Id.* at 57 tbl.6.5.

of \$3,000 to \$10,000 per ton of emissions reduced.<sup>96</sup> The 2013 area source rules include restrictions on commercial cooking, consumer products, printing, and publishing.<sup>97</sup> Other area sources include “[h]ome heating, agricultural burning and harvesting, construction, residential and commercial energy generation, wildfires, and biogenics (emissions from vegetation).”<sup>98</sup>

Among the new area source regulations are controls on wood burning, which are based on research pointing to this source being an important contributor to winter pollution.<sup>99</sup> Along the Wasatch Front, wood burning contributes 5–15% of the direct PM<sub>2.5</sub> during inversions.<sup>100</sup> The Utah DAQ lists solid fuel burning as the most important area source of pollution in 2014 with emissions of 71.1% of the NO<sub>x</sub>, 95.8% of the PM<sub>2.5</sub>, and 35.4% of the VOCs from area sources.<sup>101</sup> Two regulations that went into effect January 1, 2014, target the burning of solid fuel. Rule R307-207 establishes emission standards for residential fireplaces and solid fuel burning devices.<sup>102</sup> A second rule, R307-302, applies to solid fuel burning devices in the PM<sub>10</sub> and PM<sub>2.5</sub> nonattainment and maintenance areas in seven counties.<sup>103</sup> Residential wood burning is restricted when PM<sub>2.5</sub> levels reach 25 µg/m<sup>3</sup>, which occurred thirty-three times in the winter of 2012–2013. However, about 207 homes are exempted in the Utah nonattainment areas because wood is their sole source of heat.<sup>104</sup> During times when solid fuel burning devices and fireplaces may be used, R307-302-5 imposes opacity limits on visible emissions. There are also provisions for no-burn periods when carbon monoxide reaches levels specified in R307-302-4.<sup>105</sup>

Enforcement of the rule limiting the use of wood as a source of residential heat is difficult and is unlikely to occur. There are an estimated 36,822 wood-burning stoves and fireplaces in the seven nonattainment counties.<sup>106</sup> While fines are \$25 for a first offense, \$150 for a second offense, and can be as high as \$299,

<sup>106</sup> Christopher Smart, *Can SLC Smoke Out Burning Violators?*, SALT LAKE TRIB., Jan. 25, 2014, at B1.

there are few inspectors, and they do not work after 5 p.m., when most of the burning takes place.<sup>107</sup> In the winter of 2012–2013, there were sixteen citations issued; from 2013 to mid-January 2014 there were twenty-eight citations issued in the seven counties.<sup>108</sup> On March 12, 2014, the Utah Senate acted on H.B. 154 that aimed to lower emissions from wood burning. It made the program completely voluntary and removed two-thirds of the money approved by the House and sent the bill back to the House.<sup>109</sup> Thus, the program is largely irrelevant at this time.

Emissions from stationary sources are primarily controlled through permits issued by Utah's DAQ.<sup>110</sup> The permitting branch's New Source Review (NSR) section issues permits to new and modified sources of air emissions. Utah requires an air quality permit to build, own, or operate a facility that releases pollution into the atmosphere. The permit is called an approval order. New or modified sources, if not exempted, must obtain approval orders.<sup>111</sup> Utah's air pollution laws track the CAA closely and do not add additional requirements that are not federally mandated.

Utah has a small source exemption for sources of less than five tons per year (tpy) of a criteria pollutant or VOCs, less than 500 pounds per year of a hazardous air pollutant (HAP), or two thousand pounds per year of any combination of HAPs.<sup>112</sup> Utah's DAQ is to maintain a registry of sources claiming a small source exemption.<sup>113</sup>

Small sources having emissions that exceed the small source exemption need to obtain an approval order if they seek to construct, modify or relocate a facility.<sup>114</sup> Since 1969, an approval order has been required for most new or modified facilities. The approval order may include limits on both construction and operations. The approval order process begins with an applicant submitting a notice of intent (NOI) using DAQ forms that contains the information required by the division. The regulation lists ten requirements that must be met, including the need to comply with any requirements in the SIP.<sup>115</sup> Utah's DAQ reviews the NOI and, if it is satisfactory, issues an approval order that requires the application of the

best available control technology (BACT).<sup>116</sup> Utah's DEQ lists about one thousand approval orders that have been issued since July 1, 2007.<sup>117</sup>

On January 3, 2014, the EPA's Administrator signed a proposed rule that applies to new wood stoves and other wood combustion devices.<sup>118</sup> The proposed rule would replace the 1988 new source performance standard for PM of 7.5 grams per hour (g/hr) for noncatalytic stoves and PM of 4.1g/hr for stoves with catalysts. A 4.5 g/hr standard will apply to all new wood stoves and pellet heaters. Five years after the rule is finalized, the standard would become 1.3 g/hr.<sup>119</sup> Federal standards do not remove the need for state regulation because up to two-thirds of the existing woodstoves were manufactured prior to the 1988 standards.<sup>120</sup>

### C. Point Sources

Point sources are usually sources with emissions of 100 tpy or more of a regulated pollutant.<sup>121</sup> They are also often known as "major sources," which is defined at CAA § 302(j).<sup>122</sup> Utah follows the federal law and defines major source as a source with the potential to emit more than 100 tpy of a regulated pollutant, 10 tpy of a hazardous air pollutant, or 25 tpy of aggregated hazardous air pollutants.<sup>123</sup> The definition of major source was changed by the 1990 CAA Amendments to include many additional facilities because the amendments lowered the usual 100 tpy of a pollutant threshold for the imposition of major source requirements to a lower threshold based on the pollutants the source emits and the degree of nonattainment in the area where it is located. For example, in areas designated as serious for PM<sub>10</sub>, a major source is one with the potential to emit at least 70 tpy of PM<sub>10</sub>.<sup>124</sup> Fugitive emissions are counted only from a list of twenty-six industrial classifications plus any sources regulated on August 7, 1980, under CAA §§ 111 or 112.<sup>125</sup> New major sources and major modifications of sources that are major for the pollutant for which the area is designated nonattainment are required to obtain

<sup>123</sup> UTAH ADMIN. CODE r. 307-415-3 (2012); 42 U.S.C. § 7412(a)(1) (defining major source as a source of 10 tpy of a HAP or 25 tpy of a combination of HAPs).

<sup>124</sup> Clean Air Act § 188(b)(3), 42 U.S.C. § 7513a(b)(3) (2012).

<sup>125</sup> 40 C.F.R. § 70.2 (2014).

a nonattainment area construction permit.<sup>126</sup> Major sources are also required to obtain operating permits required by Title V of the CAA.<sup>127</sup>

The Salt Lake nonattainment area's point source category in 2014 is responsible for 23.2% of the winter PM<sub>2.5</sub>, 7.6% of the VOCs, and 16.0% of the NO<sub>x</sub>.<sup>128</sup> Point sources in 2019 are projected to increase emissions from the 2010 base year by 21.3% for PM<sub>2.5</sub>, 45.5% for VOCs, and 28.2% for NO<sub>x</sub>.<sup>129</sup> Total PM<sub>2.5</sub> in 2010 was 19.6 tons per day (tpd), and is projected to be 17.3 tpd in 2019, which is an 11.7% reduction from the 2010 baseline.<sup>130</sup> VOC emissions from point sources are projected to increase 45.5%, but overall VOCs will decrease 34.3%. Reductions from mobile and area sources are being used by Utah's DAQ to allow point source PM<sub>2.5</sub> and VOC emissions to increase. Point source emissions are dominated by a small number of sources. Kennecott's weekday winter operations in 2014, for example, account for 41.1% of the PM<sub>2.5</sub>, 57.2% of the NO<sub>x</sub>, 9.07% of the VOC, and 41.9% of the SO<sub>2</sub> in the Salt Lake nonattainment area.<sup>131</sup> Hill Air Force Base is responsible for more than 10% of the VOC emissions from point sources in 2014.<sup>132</sup>

The SIP is being crafted to allow some of the largest point sources to increase their emissions. Winter emissions of PM<sub>2.5</sub> from Kennecott's Mine Concentrator will increase from 0.65 tpd to 0.85 tpd, and PM<sub>2.5</sub> emissions from its smelter will increase from 0.61 to 0.96 tpd; Nucor Steel will more than double its PM<sub>2.5</sub> emissions and double its VOC emissions, and Proctor & Gamble Paper Products Co. will increase its PM<sub>2.5</sub> emissions by over 600% and increase its VOC emissions by over 1000%.<sup>133</sup> Some of the petroleum refineries, discussed *infra*, also will be allowed to increase emissions.

In Utah, the EPA's authority to issue operating permits has been delegated to the DAQ, and its operating permits section issues the permits for major stationary sources. Utah has issued seventy-one operating permits to major sources,<sup>134</sup> and there are forty-two sources with operating permits in Utah's three PM<sub>2.5</sub> nonattainment areas.<sup>135</sup> In the Salt Lake nonattainment area there are twenty-eight stationary sources that emit 100 tpy of PM<sub>2.5</sub> or its precursors.<sup>136</sup> Operating permits

<sup>135</sup> *Id.*

<sup>136</sup> UTAH PM<sub>2.5</sub> SIP, *supra* note 46, at 53–54.

usually impose emission limits but may include limits on production rates, hours of operation, fuel consumption, and other requirements.<sup>137</sup> Utah's regulations do not usually establish any control requirements beyond those established by applicable federal requirements but may establish new monitoring, recordkeeping, and reporting requirements.<sup>138</sup> The regulations provide a list of minor emission generating activities that do not require operating permit applications.<sup>139</sup> The regulations also provide a procedure for modifying or revising a permit.<sup>140</sup> All operating permit terms and conditions are enforceable by the EPA and citizens unless the conditions are specifically designated as state requirements that are not federally enforceable.<sup>141</sup> Utah regulations provide a "synthetic minor" provision that allows a source to avoid regulation as a major source by obtaining an approval order under R307-401 that reduces the potential to emit below the trigger amount under federally enforceable conditions.<sup>142</sup>

#### *D. Salt Lake Area Refineries*

There are five refineries in the Salt Lake PM<sub>2.5</sub> nonattainment area.<sup>143</sup> In 2010 the five refineries were responsible for 39.6% of the winter inversion PM<sub>2.5</sub> and 58% of the winter VOCs released from point sources, which are the two most important pollutants associated with the PM<sub>2.5</sub> nonattainment status.<sup>144</sup> In 2010, the winter inversion emissions from the refineries was 1.54 tpd for PM<sub>2.5</sub> and 3.77 tpd for VOCs; in 2019, PM<sub>2.5</sub> is projected to decrease to 0.68 tpd, but VOC emissions are expected to increase to 4.16 tpd.<sup>145</sup> Both refinery and point source VOC emissions are projected to increase, and, in 2019, the local refineries are projected to be the source of half of the winter inversion emissions of VOCs from point sources.<sup>146</sup>

The normal practice is for the SIP requirements applicable to major sources, as well as other requirements imposed by the CAA, to be incorporated into a Title V operating permit.<sup>147</sup> However, none of the Salt Lake area refineries have such

<sup>146</sup> The SIP shows no emissions from the Silver Eagle Refinery for 2014 and thereafter, which means all post-2010 data for refineries is based on four local refinery emissions. *See id.* at 53–54.

<sup>147</sup> *See* Clean Air Act §§ 501–507, 42 U.S.C. §§ 7661–7661f (2012).

permits because of a quarrel that has gone on since 1994 between Utah's Division of Air Quality and the EPA's Region 8.<sup>148</sup> Both of the organizations agree that this has not had an adverse impact on air quality because both the refineries and regulatory agencies understand the applicable requirements.<sup>149</sup> However, the failure to issue operating permits to the refineries may increase the difficulty of successfully enforcing the law; it makes it more difficult for citizens to know what requirements are being imposed on sources, and it makes it more difficult for citizens to use the citizen suit provision of the CAA.<sup>150</sup> On December 23, 2013, WildEarth Guardians filed a lawsuit against the EPA for its failure to grant the Bonaza power plant's permit application filed back in 2012.<sup>151</sup> On May 13, 2014, the EPA promulgated a proposed consent decree that would require the Agency to issue a final Title V permit by August 29, 2014.<sup>152</sup> This decision may be applicable to facilities without operating permits in the Salt Lake nonattainment area. On October 30, 2014, a complaint and petition for injunctive and declaratory relief was filed by Utah Physicians for a Healthy Environment and Friends of Great Salt Lake against Utah Division of Air Quality in an effort to force the state to take final action on an operating permit application filed about May 6, 1998 that was submitted for the Tesoro Salt Lake City refinery.<sup>153</sup>

The five refineries process oil brought by pipeline and by truck from Utah, Wyoming, Colorado, and Canada. Pipelines deliver refined products to Idaho, eastern Oregon, eastern Washington, Las Vegas, and Nevada; they bring refined products to the Salt Lake area from Wyoming and Montana.<sup>154</sup> Three of the refineries, Tesoro, Holly, and Chevron, are seeking construction permits to modify their facilities in order to expand their capacity to process the black wax and yellow wax crude oil feedstock that is trucked about 175 miles from the Uintah Basin in eastern Utah.<sup>155</sup>

<sup>155</sup> Dawn House, *Drill Baby, Drill But at a Cost*, SALT LAKE TRIB., June 3, 2012, at A1.

In 2010, Tesoro's refinery in North Salt Lake was Utah's largest source of direct PM<sub>2.5</sub> emissions.<sup>156</sup> By 2014, Tesoro will be required to reduce its direct winter PM<sub>2.5</sub> emissions of 0.71 tpd in 2010 to 0.28 tpd.<sup>157</sup> In 2019, when Utah is projected to attain the PM<sub>2.5</sub> NAAQS, Tesoro is projected to have a PM<sub>2.5</sub> cap of 0.27 tpd.<sup>158</sup> However, its VOC emissions will increase from 0.81 tpd in 2010 to 1.01 tpd in 2019—nearly a 25% increase.<sup>159</sup> On September 13, 2013, Utah's DAQ approved Tesoro's modification to increase its throughput capacity by 7%,<sup>160</sup> which is expected to result in a 16% increase in VOC emissions and an 8% reduction in sulfur emissions.<sup>161</sup> In February 2014, Tesoro proposed a 135-mile pipeline from the Uinta Basin to the Salt Lake City area, which will carry up to sixty thousand barrels a day and would replace many of the trucks carrying waxy crude oil on U.S. Route 40 and Interstate 80.<sup>162</sup> This pipeline will allow the refineries to further expand.<sup>163</sup>

The Holly refinery ("Holly") is projected to increase its winter PM<sub>2.5</sub> emissions from 0.15 tpd in 2010 to 0.22 tpd in 2017 and its VOC emissions from 0.66 tpd to 0.67 tpd.<sup>164</sup> However, Holly seeks to expand its Utah facility's present ability to process 10,000 bbl/d of Uintah waxy crudes by adding capacity to process an additional 24,000 bbl/d in Phase I and an additional 30,000 bbl/d in Phase II, which will increase the refinery's total capacity from 31,000 to 60,000 bbl/d.<sup>165</sup> Holly claims there will be a 378.5 tpy decrease in sulfur dioxide (SO<sub>2</sub>) emissions, a decrease in PM<sub>10</sub> of 22.6 tpy, and a decrease of 3.2 tpy for PM<sub>2.5</sub>, but NO<sub>x</sub> emissions will increase 37.7 tpy, VOCs will increase 5.8 tpy, CO will increase 500.7 tpy, lead will increase 0.002 tpy, and HAPs will increase 19.7 tpy, with 8.8

<sup>165</sup> See Letter from Michael S. Astin, Env'tl. Manager at Holly Ref. & Mktg. Co., to Bryce Bird, Director, Utah Div. of Air Quality (Mar. 21, 2013) (on file with the Utah Law Review); *Woods Cross Refinery*, HOLLYFRONTIER CORP., [http://hollyfrontier.com/media/files/files/108d2ba0/Woods\\_Cross\\_Phase\\_1\\_Expansion\\_Update.pdf](http://hollyfrontier.com/media/files/files/108d2ba0/Woods_Cross_Phase_1_Expansion_Update.pdf), archived at <http://perma.cc/U7AM-27B7> (last visited Sept. 21, 2014).

typy of the increase coming from hexane releases.<sup>166</sup> To achieve these reductions, Holly's Phase I program includes upgrading existing pollution controls, installing a second fluid catalytic cracking unit (which would be dismantled and moved from a New Mexico facility), and replacing gas-fired compressors with other compressors powered by electricity.<sup>167</sup>

Opponents of the expansion claim that Holly is seeking credit for the emissions reduction it is required to achieve under an existing consent decree with the EPA.<sup>168</sup> Moreover, there appears to be an inconsistency between Utah's DAQ SIP projections for winter emissions and Holly's annual projections. However, the EPA and Utah's DAQ, on November 18, 2013, granted Holly permission to expand, meaning Holly's claimed emissions reductions are considered legally sufficient.<sup>169</sup> It is expected that the Utah DAQ's approval will be the subject of litigation.<sup>170</sup> On December 20, 2013, the Western Resource Associates, which represents Utah environmental organizations, filed a petition with Utah's DEQ claiming that the state is using unproven formulas to predict emissions from the expanded facility that results in volumes fifteen times lower than the standard formula.<sup>171</sup> Other environmental groups are insisting that the oil refineries install wet-gas scrubbers and use selective catalytic reduction.<sup>172</sup>

A larger refinery in Utah is Chevron's North Salt Lake refinery, which can process 45,000 bbl/d.<sup>173</sup> Chevron plans an \$83 million modification to its facility in order to handle a wider range of crude products (including waxy Utah crude), but it does not plan to increase the facility's capacity.<sup>174</sup> Chevron will be required to reduce PM<sub>2.5</sub> winter emissions from 0.50 to 0.10 tpd by 2019, but VOC emissions will increase from 0.66 tpd to 1.23 tpd in 2019.<sup>175</sup>

Big West Oil, a subsidiary of FJ Management Inc., operates a refinery in North Salt Lake with a capacity of 35,000 bbl/d.<sup>176</sup> It refines Utah, Wyoming, and

### III. CONCLUSION AND ISSUES FOR FURTHER STUDY

If the Salt Lake area is to actually achieve the NAAQS for PM<sub>2.5</sub>, more stringent controls than those proposed in the SIP revisions will probably be needed. The SIP process discussed above aims to achieve the atmospheric air quality goals by reducing emissions from mobile and stationary source categories. A share of the total emissions reduction is allocated to each of the emission source categories and then to the sources within a category. Emissions from motor vehicles compete with stationary sources to use the finite capacity of the atmosphere to transport and disperse pollution emissions. The failure to adequately control a source category or an industrial classification within a source category increases the pressure on other source categories or industrial classifications to reduce emissions to meet the NAAQS. Nevertheless, affected sources frequently attempt to shift the responsibility for reducing air pollution to other emission sources. This leads to a failure to meet prescribed goals, followed by more stringent statutory or regulatory requirements. SIP revisions are produced and emissions are reduced, but for many nonattainment areas, the goal of reaching NAAQS remains elusive. This problem is exacerbated by the increasing stringency of the NAAQS as they are revised. Some of the issues that need additional study are discussed below.

First, Utah's SIP revision identifies mobile sources as the most significant source of emissions leading to the violation of the PM<sub>2.5</sub> NAAQS.<sup>187</sup> This places much of the responsibility for reducing Utah's PM<sub>2.5</sub> emissions on the federal government, which establishes the emission standards for new motor vehicles. Thus, Utah is depending on the federal government to provide much of the reduction needed to meet the PM<sub>2.5</sub> standard. However, improved vehicle emissions will be nullified if people drive more miles. States have the power to regulate vehicles after they are sold to consumers, but efforts to control vehicle use are difficult to implement because of the large number of vehicles and the public opposition to control measures. Little effort has been made in Utah to reduce driving. Utah should be making greater efforts to reduce the use of motor vehicles and should be working to encourage motorists to purchase vehicles with lower environmental impacts.

Second, Utah's DAQ has identified area sources as the second most important source of emissions responsible for violating the PM<sub>2.5</sub> NAAQS.<sup>188</sup> Utah's DAQ identifies solid fuel burning as the most significant area wide source of air pollutants.<sup>189</sup> Regulations applicable to wood stoves and fireplaces in the nonattainment areas went into effect January 1, 2014.<sup>190</sup> However, because there

---

<sup>187</sup> See UTAH PM<sub>2.5</sub> SIP, *supra* note 46, at 25 tbl.4.1.

<sup>188</sup> See *id.*

<sup>189</sup> *Id.* at 57.

<sup>190</sup> *Id.*

are over thirty-six thousand sources,<sup>191</sup> regulation will be resource intensive, expensive, and unpopular. This may make it difficult to achieve the projected 2019 emission reductions.<sup>192</sup>

Third, Salt Lake's point source category in 2014 is responsible for 23.2% of the PM<sub>2.5</sub>, 7.6% of the VOCs, and 16.0% of the NO<sub>x</sub>.<sup>193</sup> Point sources in 2019 are projected to increase emissions by 21.3% for PM<sub>2.5</sub>, 45% for VOCs, and 28.2% for NO<sub>x</sub> from the 2010 base year.<sup>194</sup> The EPA's mandated reductions in mobile source emissions are used by Utah to allow point source emissions to increase.<sup>195</sup> Utah's forty-one major stationary sources located in the three PM<sub>2.5</sub> nonattainment areas have less stringent emission reduction requirements than mobile sources. Utah's petroleum refineries, one of the most important sources of point source emissions, are operating under state permits that have not been approved by the EPA because of disagreement over the terms of the permits.<sup>196</sup> Moreover, the pending expansion of several refineries will add to the valley's emissions. In addition, the permits may not be sufficiently stringent.

Fourth, PM<sub>2.5</sub> emissions can include emissions of HAPs, which have potential public health impacts that are more serious than generic particulate emissions. It is not clear whether the public is being adequately protected from HAP emission sources. Moreover, reporting requirements appear to be lax.

Fifth, more research is needed concerning the extent to which transportation planning is being integrated with the SIP. Expanded mass transit is necessary if VMTs are to be reduced, and the public appears to be willing to support such efforts.<sup>197</sup> Alternative transportation measures individually produce only small reductions in emissions, but every ton of PM<sub>2.5</sub> and its precursors that can be eliminated moves the region closer to the quality of life that most residents desire. Moreover, transportation planning should be integrated with land use planning in order to increase population density and minimize suburban sprawl because higher population densities leads to less energy use per capita.

Sixth, CAA § 116 allows states to impose more stringent emission standards.<sup>198</sup> Utah's air quality problem is exacerbated by its topography that leads to extended winter inversions as well as a population growth rate of 1.6%, which is more than double the nation's growth rate of 0.7%.<sup>199</sup> Moreover, in Utah 90% of the population lives on 1% of the land, and the population is expected to grow 67%

---

<sup>199</sup> Lee Davidson, *Oil Boom Triggers Growth*, SALT LAKE TRIB., Mar. 27, 2014, at A1.

in the next thirty years.<sup>200</sup> Utah needs an air quality solution. But Utah law generally prohibits Utah's DAQ from imposing any air pollution control requirements that are more stringent than federal regulations.<sup>201</sup> Utah's air quality can be improved using the CAA, including SIP revisions. But air quality improvement could benefit from approaches that are unlikely to occur unless the Utah legislature gives Utah's DAQ and other state agencies more authority to create a Utah solution.<sup>202</sup> This would include improvements to mass transit, limitations on highway construction, discouragement of urban sprawl, tightened building codes, and efforts to support energy conservation and the use of nonfossil fuel. Depending solely on the EPA's requirements to improve our air quality will not solve our problem.<sup>203</sup>

Finally, the overall challenge is to deal with what the ecologist Garrett Hardin called the Tragedy of the Commons.<sup>204</sup> Each individual, acting rationally, will use shared resources until the resource is depleted, even if the larger society is seriously harmed. Whether it is idling automobiles or burning wood during inversions, the challenge for the legal system is to devise ways to protect the common need for an atmosphere that is safe while having the minimum adverse impact on the economy and personal freedom.
