THE CONTROL OF METHANE AND VOC EMISSIONS FROM OIL AND GAS OPERATIONS IN THE WESTERN UNITED STATES

ARNOLD W. REITZE, JR.*

ABSTRACT

This article discusses the regulation of hydrocarbon emissions, including the emissions of methane, a potent greenhouse gas, from the oil and gas industry in the western United States. It covers the regulations of the Environmental Protection Agency, the Bureau of Land Management, and other Federal agencies. It also discusses the state laws of the major oil and gas producing western states: California, Colorado, New Mexico, Utah, and Wyoming. It covers operations on public, state, and private lands, but it does not cover oil and gas operations on Indian lands that are the subject of the author's previous article.¹

I. INTRODUCTION

Methane is produced biologically in ruminants (animals with a four-part stomach) and is generated in landfills and by waste handling.² However, this article focuses on methane as the principal component of natural gas.³ Methane is one of several non-reactive hydrocarbons. Most hydrocarbons are chemically reactive and are called volatile organic compounds (VOCs). The Environmental Protection Agency's (EPA) regulations exclude methane from VOC designation.⁴ VOC emissions are regulated by the Clean Air Act (CAA) because they play a significant role in the creation of photochemical oxidants, which are regulated by the ozone standards.⁵ In addition to the general emission requirements used to improve ambient air quality, VOCs from specific operations may be regulated by new source performance standards (NSPS)⁶ and by national emissions standards for hazardous air pollutants (NESHAPs).⁷ Measures aimed at controlling VOCs also result in the reduction of non-reactive chemical emissions, such as methane, that are emitted along with VOC emissions. In recent years concern over climate change has led to attention being directed at controlling methane emissions because methane is a potent greenhouse gas (GHG).⁸ It is also subject to photo-oxidation that produces tropospheric ozone pollution, a conventional pollutant.⁹

From about 1750 to 2015, global concentrations of methane have increased by 162%.¹⁰ Worldwide, methane is responsible for about 20% of the global

warming.¹¹ Methane emissions are 10% of the U.S. GHG emissions.¹² However, from 1990 to 2015, total U.S. emissions of methane have decreased by 16%.¹³ Agricultural animal operations (enteric fermentation) were the source of 25.4% of U.S. GHG emissions in 2015.¹⁴ Natural gas operations were responsible for 24.43%.¹⁵ Petroleum systems emitted 6.1% of the methane in 2015.¹⁶ Overall, the energy sector was responsible for 42% of the methane emissions in 2015.¹⁷ However, a 2017 study from Purdue University suggests that methane emissions from power plants and refineries have been significantly underestimated.¹⁸

Carbon dioxide (CO₂) is responsible for 82.2% of the U.S. GHG emissions,¹⁹ but methane and nitrous oxide are also important GHGs.²⁰ GHGs are expressed as carbon dioxide equivalents (CO_{2e}) based on their global warming potential (GWP).²¹ The GWP of a GHG is determined by estimating the radiative force of a gas and its expected residency time in the atmosphere.²² CO₂ has a relatively low instantaneous radiative force, but it remains in the atmosphere for 100 years or more.²³ The GWP of CO₂ is based on a 100-year time horizon and CO₂ is denoted as 1; methane (CH₄) is 25; nitrous oxide (N₂O) is 298; hydrofluorocarbons have a GWP that ranges from 124 to 14,800; perfluorocarbons have a GWP that ranges from 8,860 to 12,200; and sulfur hexafluoride (SF₆) is 22,800.²⁴ However, the atmospheric lifetime of methane is much shorter than carbon dioxide, and if a twenty-year timespan is used the GWP would be between 72 to 84.²⁵ The Intergovernmental Panel on Climate Change (IPCC) publishes and updates the GWP of GHGs. The weight of a GHG times its GWP gives its CO_{2e}, which is usually expressed in tera grams (Tg) (or million metric tons) of CO_{2e}.²⁶

Petroleum systems, which include production, transportation, and refining, are the source of nearly 15% of the U.S. methane emissions.²⁷ Production-related emissions account for approximately 98% of the petroleum industry's methane emissions, and about 85% of these emissions are due to the venting of methane.²⁸ Production emissions come from "pneumatic controllers, offshore oil platforms,

associated gas venting and flaring, gas engines, chemical injection pumps, oil tanks, hydraulically fractured oil well completions, and fugitives from oil wellheads.”²⁹ Venting from pneumatic controllers accounts for approximately 85% of production related methane emissions.³⁰ In 2015, methane emissions from production decreased about 8% from 2014, with most of the reduction attributable to the control of venting and flaring.³¹ Transportation activities are responsible for only 1% of the methane emissions and refining operations account for only 2%.³²

In 2015, the U.S. natural gas systems were comprised of 440,496 wells,³³ hundreds of processing facilities, and more than a million miles of pipelines.³⁴ About 57% of the methane emitted by the energy sector comes from natural gas operations.³⁵ Methane is released from wells and well-site gas treatment.³⁶ The production phase also includes releases from the gathering and boosting operations that receive natural gas and transfer it via gathering pipelines to transmission pipelines or processing facilities.³⁷ About 65% of the methane is emitted during the production stage.³⁸ From 1900 to 2015, there was a 51% increase in production-related methane emissions and were primarily from increases in production.³⁹

Natural gas must be processed to create pipeline quality gas by removing natural gas liquids and other constituents from raw gas.⁴⁰ Processing plants release about 7% of the methane.⁴¹ Methane emissions from processing decreased by 48% from 1990 to 2015 because emissions from equipment leak, compressor leaks, and venting are better controlled.⁴² Transmission and storage account for about 21% of the methane emissions from the natural gas systems.⁴³ Methane emissions from transmission and storage “decreased by 42 percent from 1990 to 2015 due to reduced compressor station emissions”⁴⁴ Distribution of natural gas involves reducing the high-pressure gas in the distribution pipelines so that it can be delivered to customers.⁴⁵ There are 1,274,976 miles of distribution mains, which are responsible for about 7% of the methane emissions from natural gas systems.⁴⁶

Methane emissions from distribution decreased by 75% since 1990.⁴⁷ It is worth emphasizing that methane emissions from the production of natural gas dominates these emissions from natural gas systems.⁴⁸

II. EPA'S REGULATIONS

The regulations applicable to oil and gas operations include the EPA's NSPS for the oil and gas industry, discussed below, and NSPS for specific equipment including compression ignition and spark ignition engines.⁴⁹ Oil and gas facilities must also comply with the EPA's NESHAPs such as the rule for reciprocating internal combustion engines used in their operations.⁵⁰ Oil and Gas operations on public lands and Indian lands require an Application for a Permit to Drill (APD) to be submitted and approved by the Bureau of Land Management (BLM).⁵¹ Moreover, there are additional voluntary programs for the oil and gas industry aimed at reducing their air pollution emissions.⁵² These programs, including the Coalbed Methane Outreach Program, are in danger of being eliminated by the Trump Administration.⁵³ Oil and gas operations are subject to additional regulation by the states.⁵⁴ It is important to recognize the EPA's role in regulating GHGs is subject to change because of its Administrator, Scott Pruitt, opposes many federal regulations impacting the oil and gas industry.⁵⁵

A. NSPS/HAPs

The EPA first listed oil and gas production facilities as a priority for the promulgation of NSPS in 1979.⁵⁶ In 1985, the EPA promulgated NSPS for natural gas processing plants aimed at controlling VOC emissions from leaking components.⁵⁷ Later that year the EPA regulated sulfur dioxide (SO₂) emissions from natural gas processing plants.⁵⁸ In 2012, the EPA expanded its coverage of the oil and gas industry with the promulgation of its NSPS/HAP regulation for the Crude Oil and

58. Standards of Performance for New Stationary Sources; Onshore Natural Gas Processing SO₂ Emissions, 50 Fed. Reg. 40,158 (Oct. 1, 1985) (codified at 40 C.F.R. pt. 60).

Natural Gas Production and Onshore Natural Gas Processing Plant source category.⁵⁹ The EPA's rule was based on regulations previously promulgated by Colorado and Wyoming.⁶⁰ In 2013 and 2014, the EPA amended the NSPS to improve implementation.⁶¹

The 2012 NSPS applies to well completions, pneumatic controllers, equipment leaks from natural gas processing plants, sweetening units at natural gas processing plants, compressors, and storage vessels that began construction, modification, or reconstruction after August 23, 2011.⁶² Well completions after January 1, 2015, are subject to the NSPS during the flowback period after hydraulic fracturing operations at gas wells.⁶³ "These completions include those conducted at newly drilled and fractured wells, as well as completions conducted following refracturing operations that may occur at various times over the life of the well."⁶⁴ The NSPS also applies to onshore sweetening units that process natural gas from onshore or offshore wells.⁶⁵

The NSPS for the Crude Oil and Natural Gas Production source category sets performance standards that limit "[VOC] emissions from gas wells, centrifugal compressors, reciprocating compressors, pneumatic controllers, storage vessels and leaking components at onshore natural gas processing plants, as well as sulfur dioxide (SO₂) emissions from onshore natural gas processing plants."⁶⁶ The rule regulates onshore wells drilled principally for the production of natural gas, but it does not regulate wells drilled principally for the production of crude oil.⁶⁷ Fractured and refractured gas wells are required to use reduced emissions completions, "also known as 'RECs' or 'green completions,' to reduce VOC emissions."⁶⁸ This may involve the use of a combustion device to limit VOC emissions.⁶⁹

For example, individual storage vessels in the oil and natural gas production segment and the natural gas processing, transmission, and storage segments must

achieve at least 95.0% emissions reduction if their VOC emissions are equal to or greater than six tons per year (tpy).⁷⁰ Pneumatic controllers located between the wellhead and the point at which the gas enters the transmission and storage segment have natural gas bleed limits.⁷¹ Pneumatic controllers are used to open or close valves, control liquid levels, control temperature, or control pressure. They usually are powered by natural gas, which results in venting each time the controller is activated.⁷² Therefore, they constitute a release pathway that must be included in a methane control program. Centrifugal compressors also have VOC reduction requirements.⁷³ In addition, the NSPS impose requirements for leak detection and repair (LDAR) and SO₂ emissions on onshore natural gas processing plants.⁷⁴

Oil and natural gas production facilities were listed as source categories pursuant to CAA § 112 in 1992.⁷⁵ Transmission and storage facilities were added in 1998.⁷⁶ National Emission Standards for Hazardous Air Pollutants (NESHAPs) were established in 1999 for major sources of hazardous air pollutants (HAPs).⁷⁷ In 2007, benzene emissions from tri-ethylene glycol dehydration units were included in the NESHAP.⁷⁸ In 2012, the EPA revised and strengthened the NESHAP for the Oil and Natural Gas Production source category and the Natural Gas Transmission and Storage source category.⁷⁹

The EPA has established maximum achievable control technology (MACT) standards for specified emission sources in the oil and gas industry.⁸⁰ Major sources at oil and natural gas production facilities may be subject to the NESHAP for glycol dehydration units, which includes MACT standards for “small” glycol dehydration units that include specific limits for benzene, toluene, ethylbenzene, and xylene (BTEX).⁸¹

The 2012 NSPS for crude oil and natural gas production did not include emission standards for methane; the EPA expected that the NSPS regulation of

VOCs would result in methane reduction as a “co-benefit.”⁸² Because methane is emitted with VOCs,⁸³ the controls on VOCs emissions would lead to an annual reduction of one million tons of methane.⁸⁴

B. Oil and Natural Gas Sector: Emission Standards for Methane from New and Modified Sources

On September 18, 2015, the EPA proposed amendments to the NSPS for the oil and gas sources category to expand the coverage of oil and gas VOC emissions to include controls on methane emissions.⁸⁵ The EPA finalized the proposed rule on June 3, 2016.⁸⁶ The EPA regulation of methane emissions from oil and gas wells was challenged by North Dakota in the D.C. Circuit on July 15, 2016.⁸⁷ Fourteen states then joined the lawsuit as well as numerous industry organizations.⁸⁸ Subsequently, nine states and numerous environmental groups intervened to support EPA’s CAA § 111(b) rule.⁸⁹ The methane rule is controversial because compliance costs are estimated at \$530 million.⁹⁰ The cases were consolidated on January 4, 2017, and are discussed in section 2(B) below.

The NSPS are applicable to new, reconstructed, and modified oil and gas operations.⁹¹ A major weakness of the EPA’s regulatory approach is that it does not apply to existing oil and gas operations, although the EPA could regulate existing sources either under CAA § 111(d) or through State Implementation Plan (SIP) amendments required in ozone nonattainment areas.⁹² The amendments impose standards for GHGs and VOCs and add requirements applicable to operations and equipment covered by the 2012 standards.⁹³ These implementation improvements do not change the requirements for operations and equipment covered by the

93. Oil and Natural Gas Sector: Emission Standards for New and Modified Sources, 81 Fed. Reg. 35,824, 35,825–27 (June 3, 2016) (amending 40 C.F.R. pt. 60, subpt. OOOO and proposing new standards at subpt. OOOOa).⁸⁶

current standards at 40 C.F.R. part 60, subpart OOOO and OOOOa.⁹⁴ Specifically, the amendments apply to hydraulically fractured oil well completions, pneumatic pumps, and fugitive emissions from well sites and compressor stations that are not regulated by the 2012 rules; hydraulically fractured gas well completions and equipment leaks at natural gas processing plants that are currently regulated for VOC emissions are now subject to GHG regulations.⁹⁵

The 2016 rule adds new requirements for detecting and repairing leaks at natural gas well sites. Leaks, known as fugitive emissions, must be repaired within thirty days, but if a repair would shut down production then additional time for the repair is allowed.⁹⁶ Leak monitoring plans must be developed using optical gas imaging equipment or by using a portable VOC monitoring instrument as specified in EPA's Method 21.⁹⁷ The leak monitoring will apply to "valves, connectors, pressure relief devices, open-ended lines, flanges, compressors," and other components.⁹⁸ However, some wellheads that contain only "Christmas trees" are exempt.⁹⁹ The rule also adds new requirements for diaphragm pumps used at well sites.¹⁰⁰

The amendments to the NSPS rule also require a monitoring plan to be developed and implemented to control leaks at gathering and boosting compressor stations that obtain gas from multiple wells and move it to a natural gas processing plant.¹⁰¹ Because the best system for reducing methane is the same as is used to reduce VOC emissions, the requirements for centrifugal and reciprocating compressors, pneumatic controllers, and storage tanks continue to be regulated by the 2012 NSPS.¹⁰² However, the 2016 update limits methane and VOC emissions from wet seal centrifugal compressors used in the oil and gas industry, except for those located at well sites.¹⁰³ A 95% reduction of methane and VOC emissions is required by utilizing either flaring or by routing captured gas back to the processor.¹⁰⁴ Dry seal centrifugal compressors are not covered by the final rule because their methane and VOC emissions are small.¹⁰⁵ Reciprocating compressors, except for those located at well sites, are to have the rod packing replaced based on specified hours of operation or elapsed calendar months or by routing emissions from the rod packing through a closed vent system under negative pressure to be

reused or recycled.¹⁰⁶ Pneumatic controllers powered by high-pressure natural gas are used to maintain liquid levels, pressure, and temperature.¹⁰⁷ Continuous bleed pneumatic controllers now have a natural gas bleed rate limit of six standard cubic feet per hour (scfh).¹⁰⁸ Low-bleed controllers with a gas bleed rate of six scfh or less have no new requirements.¹⁰⁹ The EPA did not finalize requirements for pneumatic pumps at compressor stations.¹¹⁰ Storage tanks also do not have new requirements but continue to be regulated by the 2012 NSPS requirements.¹¹¹

Natural gas processing plants have new requirements for controlling emissions from pneumatic pumps.¹¹² Natural gas-driven piston pumps are not subject to new rules, nor are diaphragm pumps powered by electricity, compressed air, or solar power.¹¹³ Processing plants continue to be regulated primarily by the 2012 NSPS.¹¹⁴

Requirements imposed by states (and tribes) that are at least as protective as federal requirements can be used to demonstrate compliance with the federal rule.¹¹⁵ Facilities that will be subject to the EPA's standards may also be subject to current or future requirements of the Department of Interior's Bureau of Land Management (BLM), which regulates the production of natural gas on Federal lands. Therefore, the EPA and BLM will continue to coordinate their regulatory requirements.¹¹⁶ The BLM's program is discussed *infra* Part III.

In April 2017, the EPA asked the D.C. Circuit to indefinitely pause the lawsuits challenging the oil and gas NSPS due to President Trump's March 28, 2017, Executive Order on climate and energy policy that requires the EPA to immediately review agency actions that "potentially burden the safe, efficient development of domestic energy resources."¹¹⁷ This Order has the potential to alter or nullify the regulation.¹¹⁸ In April 2017, the EPA announced it was initiating its review of the Rule and provided advanced notice of forthcoming rulemaking proceedings.¹¹⁹ On April 18, 2017, EPA Administrator Scott Pruitt announced the EPA would reconsider the requirement that well owners use an infrared camera to search for leaks and

then document what they do.¹²⁰ He also responded to petroleum industry requests to stay NSPS regulations found in 40 C.F.R. Part 60, Subpart OOOOa by extending the June 3, 2017 compliance deadline for Leak Detection and Repair by three months.¹²¹ On June 16, 2017, the EPA promulgated a proposed rule that would stay oil and gas NSPS for three months.¹²² On July 3, 2017, the D.C. Circuit held that the EPA lacked authority under the CAA to stay the final rule establishing new source performance standards for fugitive emissions of methane and other pollutants by the oil and natural gas industries,¹²³ and it vacated the stay.¹²⁴ On July 13, 2017, the D.C. Circuit granted the EPA's motion to delay enforcement of the overturned ninety-day stay to allow the Agency to seek a rehearing or appeal to the Supreme Court.¹²⁵ On August 10, 2017, the full D.C. Circuit declined to review the decision that forced the EPA to enforce the oil and gas NSPS.¹²⁶ The EPA also proposed a two-year delay in order to reconsider portions of the methane limits on June 16, 2017.¹²⁷ That delay is also legally suspect.¹²⁸ According to the Environmental Defense Fund, a delay allows "nearly 41,000 well sites, 272 compressor stations and 1,090 pneumatic pumps [to] avoid conducting leak detection and repair" as well as needing to comply with other requirements of the methane rule.¹²⁹ Additional litigation over the delay is expected.¹³⁰ However, the ruling concerning the ninety-day stay does not prevent the repeal of the Methane Rule if the EPA follows a proper rulemaking process.¹³¹ That proposal continues, and a hearing was held on July 10, 2017.¹³² At about the same time, fifteen state Attorney Generals on June 29, 2017, notified the EPA that they were prepared to sue the EPA for its

unreasonable delay in issuing methane regulations for existing oil and gas operations.¹³³ While the methane rule's eventual status remains confused, the deadline for beginning to report emissions is October 2017, and the industry is trying to comply even though the EPA has issued no guidance.¹³⁴

On November 1, 2017, the EPA raised two potential changes to the methane NSPS in notices of data availability (NODA) that were posted to EPA's website and opened for a thirty-day public comment period.¹³⁵ EPA hopes to avoid additional legal challenges by characterizing the rule modifications as extensions of the 'phase-in' periods for key provisions of the methane NSPS, such as the requirement that operators find and repair leaks to control fugitive emissions and the requirement that closed vent systems be certified by a professional engineer.¹³⁶ EPA contends that it has authority under Section 111(b) of the CAA to extend compliance deadlines.¹³⁷ The NODAs propose two compliance extensions; a three month extension that would take effect immediately, followed by a two year extension.¹³⁸ Environmental groups argue there is no reasonable basis for the compliance extensions and charge the Administrator with attempting to circumvent the D.C. Circuit's ruling that the agency's 90-day stay was unlawful.¹³⁹

C. The EPA's Source Determination Rule

The Clean Air Act's Prevention of Significant Deterioration Program (PSD) preconstruction permit requirements, the Nonattainment New Source Review (NNSR) preconstruction permit program, and the Title V operating permit program apply to major sources. Major source is defined as sources in the same industrial group (the same two-digit SIC code), under common control, and located on contiguous or adjacent properties.¹⁴⁰ On June 3, 2016, the EPA promulgated the "Source Determination Rule," which will lead to more oil and gas facilities being considered major sources rather than minor sources.¹⁴¹ The new rule applies to onshore oil and natural gas production and natural gas processing facilities.¹⁴² This final rule clarifies the term adjacent, which determines when minor sources are to be aggregated and treated as a major source.¹⁴³ Multiple sources are to be

aggregated if they are on the same site, or are on sites that share equipment and are within one-quarter of a mile of each other.¹⁴⁴

The EPA is not requiring that EPA-approved state and local programs adopt the approach in the “Source Determination Rule.”¹⁴⁵ This allows state and local permitting authorities that have programs approved by the EPA to continue to make source determinations for the oil and gas “industry in the manner that they believe best addresses their local air quality concerns.”¹⁴⁶ However, “states that administer PSD permitting programs under a delegation of federal authority” will have to follow the approach of the “Source Determination Rule,” “or develop their own permitting programs and have them approved as a revision to a state implementation plan (SIP).”¹⁴⁷

“The Source Determination Rule is also expected to [result in hazardous air pollutant (HAP)] reductions and will benefit areas that approach or exceed the [National Ambient Air Quality Standards (NAAQS)] for ozone.”¹⁴⁸ “There are increasing ozone levels in areas” in the western United States that have “concentrated oil and natural gas activity, including Wyoming and Utah.”¹⁴⁹ Several VOCs emitted by sources in the oil and natural gas source category are HAPs listed under CAA § 112(b), including benzene, toluene, ethylbenzene and xylenes (this group is commonly referred to as “BTEX”) and n-hexane.¹⁵⁰

D. The EPA’s GHG Reporting Requirements

The EPA requires oil and natural gas companies to collect and report GHG emissions data for sources emitting 25,000 metric tons per year, or more, of CO_{2e}.¹⁵¹ The reporting requirements extend to facilities owned or operated by Indian tribes and private oil and gas operations on Indian reservations.¹⁵² Most production operations do not exceed the 25,000-ton threshold that triggers reporting requirements. Approximately 2,413 oil and natural gas facilities reported GHG emissions during 2015, but only 534 onshore production facilities reported.¹⁵³ Beginning January 1, 2016, additional data “from gathering and boosting systems,

completions and workovers of oil wells using hydraulic fracturing, and blowdowns of natural gas transmission pipelines” must be collected and this information must be reported beginning March 31, 2017.¹⁵⁴

Information concerning the reporting of GHG emissions from oil and gas production was promulgated on November 30, 2010.¹⁵⁵ On January 15, 2015, the EPA proposed revisions to the GHG reporting rule.¹⁵⁶ On May 12, 2016, the EPA issued a draft Information Collection Request (ICR) to require oil and natural gas companies to provide the information needed to regulate existing sources of methane emissions including underground storage facilities that are not currently regulated.¹⁵⁷ This could lead to hundreds of thousands of existing oil and gas sources that emit methane being subject to new requirements.¹⁵⁸ The EPA’s ICR was criticized by the oil and gas industry and some states, which believed the ICR was the beginning of an effort to more stringently regulate existing facilities.¹⁵⁹ On December 9, 2016, the EPA promulgated a final rule dealing with minor updates to the reporting rule.¹⁶⁰ In March 2017 the ICR was withdrawn by EPA Administrator Scott Pruitt.¹⁶¹ His action has consequences because the information that was to be collected was expected to form the basis for future more stringent regulation of existing oil and gas operations.¹⁶²

E. The EPA’s Regulation of Existing Oil and Gas Operations

The regulation of existing oil and gas operations is primarily the responsibility of the states.¹⁶³ However, if an area is designated as nonattainment, CAA section 172(c)(1) requires a state implementation plan (SIP) to include “reasonably available control measures” including “reasonably available control technologies” (RACT) for existing emission sources.¹⁶⁴ RACT means all those “technologically and economically feasible measures [available] that can be implemented within 4 years of . . . [a nonattainment] designation.”¹⁶⁵ RACT implementation does not constitute

a complete set of measures necessary to demonstrate attainment as expeditiously as possible.¹⁶⁶ Section 182 requires ozone nonattainment areas to include RACT for each category of VOC sources covered by Control Techniques Guidelines (CTG).¹⁶⁷ A CTG is merely guidance, not a regulation. SIP revisions must be submitted by two years from the publication of an applicable CTG.¹⁶⁸ EPA released its CTG for the Oil and Natural Gas Industry in 1984.¹⁶⁹

In October 2016, the EPA updated its CTG with RACT recommendations for storage vessels, pneumatic controllers, pneumatic pumps, compressors, equipment leaks, and fugitive emissions.¹⁷⁰ The cost of compliance is significant. For example, vapor recovery units to reduce VOC emissions for the Oil and Natural Gas Industry from each storage vessels will cost over \$100,000.¹⁷¹

III. BUREAU OF LAND MANAGEMENT REGULATIONS

The Bureau of Land Management (BLM), within the Department of the Interior, was created in 1946 when the Grazing Service, which managed grazing on public lands, was merged with the General Land Office.¹⁷² It carries out the regulatory duties of the Secretary of the Interior in regard to about 258 million surface acres¹⁷³ and 700 million acres of subsurface mineral estate, located primarily in the American West.¹⁷⁴ It manages BLM's mineral estate as well as the mineral estate for the U.S. Forest Service,¹⁷⁵ other Federal agencies, and it provides technical assistance involving about 56 million acres of Indian mineral estates.¹⁷⁶ It administers about 23,770 producing oil and gas leases involving about 100,000 wells, that in 2015, produced 11% of the natural gas and 7% of the oil used in the U.S.¹⁷⁷ Interior's Office of Natural Resources Revenue (ONRR) is authorized to

collect royalties on oil and gas produced on federal lands.¹⁷⁸ In fiscal year 2015, it collected nearly \$2.2 billion.¹⁷⁹ 48% of the 12.5% royalty is paid to the states.¹⁸⁰ The payments to the states are expected to be used to help rural counties and local governments that have a reduced tax base because of the federal public lands within their borders.¹⁸¹ In Utah, the money is placed in the Permanent Community Impact Fund that is overseen by an 11-member Community Impact Board.¹⁸² Recently, the Board has been criticized for the fees paid to lawyers and engineering firms and for the grants of money that are used primarily to benefit the oil and gas industry.¹⁸³

The BLM's legal authority concerning oil and gas resources is based on the Mineral Leasing Act of 1920, as amended,¹⁸⁴ the Mineral Leasing Act of 1947,¹⁸⁵ the Naval Petroleum Reserves Production Act of 1976 (Alaskan leases),¹⁸⁶ and the Federal Land Policy and Management Act of 1976 (FLPMA).¹⁸⁷ The Mineral Leasing Act of 1920 (MLA) requires lessees to "use all reasonable precautions to prevent waste of oil or gas developed in the land,"¹⁸⁸ and that leases include "a provision that such rules . . . for the prevention of undue waste as may be prescribed by [the] Secretary shall be observed."¹⁸⁹ The BLM's regulations are found in 43 C.F.R. parts 3000 and 3100.¹⁹⁰ For oil and gas operations where the surface is under the control of federal agencies other than the BLM, approval of the federal land manager (FLM) is required prior to an oil and natural gas owner/operator beginning construction.¹⁹¹

Generally, oil and gas leasing begins with the BLM's resource management plan (RMP), which governs the use of the land.¹⁹² FLPMA establishes requirements for land use planning on federal public land. It requires that the BLM "develop, maintain, and, when appropriate, revise land use plans"¹⁹³ to ensure that land management is conducted "on the basis of multiple use and sustained yield"¹⁹⁴

194. § 1701(a)(7).

The process for developing, maintaining, and revising RMPs is controlled by federal regulations.¹⁹⁵ Under FLPMA, if the BLM wishes to change an RMP, it can only do so by formally amending the plan.¹⁹⁶ There may also be a master leasing plan for areas with special resource conflicts that need to be protected.¹⁹⁷ On December 12, 2016, the BLM amended its regulations dealing with planning under FLPMA.¹⁹⁸ However, on March 27, 2017, President Trump signed Joint Resolution 44 to rescind this BLM planning rule, which will make it easier to obtain approval of oil and gas leases.¹⁹⁹

The RMP requires a National Environmental Policy Act (NEPA) review.²⁰⁰ Under this review process, the BLM is typically responsible for an environmental review prior to authorizing oil and gas leases.²⁰¹ On Indian lands, the Bureau of Indian Affairs (BIA) is also involved as it “authorizes surface activities (i.e., preparing the site for well-drilling activities and operating equipment for the production of oil and/or natural gas).”²⁰² The BLM and the BIA often enter into agreements designating one agency to take the lead in the NEPA process regarding the potential impacts of subsurface and surface activities.²⁰³ For significant projects, a full environmental impact statement (EIS) may be required.²⁰⁴ Among the important issues to be assessed are the cumulative impacts of the project and the alternatives to the project.²⁰⁵

On August 2, 2016, the White House Council on Environmental Quality (CEQ) released final guidance on considering climate change in environmental reviews.²⁰⁶ This guidance affects the federal land management agencies.²⁰⁷ On December 12, 2016, the BLM amended its regulations on the preparation of land use plans as required by the FLPMA to include direct and indirect GHG emissions analysis.²⁰⁸ The

guidance involves the need to consider both the effect of the proposed action on climate change and the effect of climate change on the proposed action.²⁰⁹ The BLM responded on January 12, 2017, with its view of the CEQ's guidance.²¹⁰ However, the Trump Administration withdrew the CEQ's guidance document for further consideration on April 5, 2017.²¹¹ The repeal of the guidance, "along with its directive not to use the social cost of carbon [as a] tool," leaves the approach to dealing with climate change issues in the NEPA process to each agency.²¹² The NEPA process begins with the development of an RMP, but after a lease is granted, a site-specific scrutiny of the proposed oil or gas project is required.²¹³

The BLM's oil and gas leasing process also triggers the need to comply with the Endangered Species Act (ESA).²¹⁴ This begins with the development of an RMP and continues through the permit stage.²¹⁵ The most important ESA provision is section 7, which requires federal agencies to consult with the U.S. Fish and Wildlife Service to ensure that any actions they undertake or authorize do not jeopardize threatened or endangered species.²¹⁶ Compliance with the ESA involves the U.S. Fish and Wildlife Service field offices assessing the impacts to threatened and endangered species and critical habitats, which results in measures implemented to protect those resources that are incorporated in the FLMs' authorization.²¹⁷ Only a small fraction of the oil and gas projects are reviewed under section 7, and when reviewed the process usually is relatively quick.²¹⁸ The BLM expedites oil and gas leasing by using "programmatic biological opinions (PBiOps) to cover multiple similar actions."²¹⁹ BLM has promulgated an Oil and Gas PBiOp on July 1, 1996, updated on September 28, 2001, that deals with small-scale oil and gas projects.²²⁰

The ESA is a controversial statute, and Congress regularly seeks to reduce the scope of the ESA.²²¹

Another statute that may impact oil and gas projects is the National Historic Preservation Act (NHPA), which requires the impact on historic property to be evaluated by State and/or Tribal Historic Preservation Offices,²²² and then appropriate measures to protect historic property must be taken by federal land managers.²²³

A permit to drill (APD) is normally a prerequisite to begin operations.²²⁴ A new well may not be drilled unless the operator first receives specific approval of its drilling plan through the submission of an application for an APD to the BLM.²²⁵ The permitting process will include a more detailed NEPA review.²²⁶ As part of the APD approval process, the BLM reviews the planned drilling activity and prepares an environmental assessment of the environmental impacts of the proposed drilling, after which the agency may approve the APD as submitted, approve it with appropriate modifications or conditions, or deny it.²²⁷ In preparing this environmental assessment, the agency may incorporate by reference the general but more comprehensive environmental analysis included within its published RMP and focus the APD's environmental assessment on the issues specific to the project covered by the APD.²²⁸ Moreover, if the area has a state implementation plan, the CAA's general conformity provision requires the SIP to demonstrate that the proposed development will not cause or contribute to violations of the CAA or delay attainment of the NAAQS.²²⁹ On September 7, 2017, the Department of Interior issued Secretarial Order 3355 to streamline environmental reviews by imposing stringent time and page limits. The details are not yet provided, but the expectation is that these changes are designed to fast-track industrial development on BLM lands.²³⁰

The process of issuing APDs has been the subject of criticism because the BLM takes an average of 257 days to process them, which is well in excess of the laws

30-day limit.²³¹ The Vernal, Utah field office has the second-largest backlog of lease applications.²³² However, as of September 2015, there were nearly 2,000 APDs issued by the Vernal office that were not being developed; there were more than 7,500 nationwide not being developed.²³³ In 2016, the BLM issued 2,184 drilling permits, but only 847 wells were being drilled on federal leases.²³⁴ BLM had 325 people working on permitting on the nation's public lands and 90 vacancies.²³⁵ The Secretary of the Interior wants the permitting process to be streamlined.²³⁶ To accomplish this, the Trump Administration's budget calls for \$16 million to expedite the APD leasing process.²³⁷

On November 18, 2016, the BLM promulgated its Waste Prevention Rule that imposes various requirements on oil and gas producers working on federal lands.²³⁸ The Rule aims to reduce waste and prevent the release of methane into the atmosphere.²³⁹ It prohibits venting of natural gas with few exceptions, including emergency venting, requires producers to reduce wasteful flaring of gas by capturing for sale, and requires producers to use an instrument approach to leak detection in order to reduce gas leaks throughout oil and gas production.²⁴⁰

The Waste Rule was challenged by the States of Wyoming, Montana, North Dakota, the Western Energy Alliance and the Independent Petroleum Association of America that were seeking a preliminary injunction to enjoin the rule from taking effect, but the Petitioners motion was rejected.²⁴¹ However, the case continues.²⁴²

A. Royalties

BLM-administered leases "shall be conditioned upon the payment of a royalty at a rate of not less than 12.5 percent in amount or value of the production removed or sold from the lease."²⁴³ The waste regulation promulgated on November 18, 2016, allows the BLM, after the effective date of the rule, to set rates at or above 12.5%.²⁴⁴ However, under the Trump Administration, the oil and gas industry can

be expected to avoid additional costs. On April 4, 2017, the Office of Natural Resources of the Department of Interior proposed to repeal the Consolidated Federal Oil & Gas and Federal Indian Coal Valuation Reform Rule, which would keep the preexisting regulation in effect.²⁴⁵ The repeal of the rule would cost the federal government an estimated \$78 million in lost royalties.²⁴⁶

Oil and gas operators on federal lands are required to submit monthly Oil and Gas Operations Reports (OGOR), which account for the oil and gas produced.²⁴⁷ Most natural gas that is produced is sold and royalties are paid, but gas that is leaked, vented, burned, or used to operate equipment at the production site is usually not subject to royalty payments unless the BLM considers the gas to be improperly released.²⁴⁸ Flaring, discussed *infra* Section III(B), has increased rapidly in recent years because oil and gas development frequently occurs in remote locations where transport is not available for the natural gas that is also produced as part of an oil operation.²⁴⁹ EPA estimates that in 2008, approximately \$58 million in federal royalty payments were avoided as a result of the venting and flaring exemption.²⁵⁰ Venting, flaring, and on-site use that is generally royalty free is the subject of BLM guidance known as Notice to Lessees and Operators of Onshore Federal and Indian Oil and Gas Leases (NTL-4a) issued in 1979.²⁵¹

The rule updates the pre-existing royalty provisions to “specifically define when a loss of gas is considered ‘unavoidable’ and royalty-free, and when it is considered ‘avoidable’ and subject to royalties.”²⁵² A natural gas loss is unavoidable if the “operator has complied with all applicable requirements and taken prudent and reasonable steps to avoid waste”²⁵³ A loss is also “unavoidable when gas is flared from a well that is not connected to a gas pipeline” and the BLM has not determined “that the loss of gas is avoidable.”²⁵⁴ “All other losses of gas . . . are deemed avoidable and subject to royalties.”²⁵⁵ Avoidable losses include releases due to operator negligence, failure to take reasonable measures to control the loss, or a failure of the operator to comply with the lease.²⁵⁶ The BLM’s guidance has been criticized by the Government Accountability Office for not providing clear and

consistent guidance.²⁵⁷ Moreover, BLM officials approve many venting or flaring requests that do not comply with the existing guidance.²⁵⁸

B. Waste, Venting and Flaring

On January 22, 2016, BLM announced its proposed methane and waste reduction regulation that would update the guidance on venting, flaring, and controlling equipment leaks.²⁵⁹ Venting results in methane being released into the atmosphere with its much higher GHG impact; flaring combusts natural gas and produces carbon dioxide as well as conventional air pollutants.²⁶⁰

The BLM's Waste Prevention final rule, issued on November 18, 2016, aims to reduce the waste of natural gas from operations based on mineral leases administered by the bureau.²⁶¹ While oil and gas production technology has advanced dramatically in recent years, the BLM's rules to minimize waste of gas have not been updated in over 30 years, although the technology used in the oil and gas industry has changed dramatically. Over the past decade, the United States has experienced a dramatic increase in oil and natural gas production, but BLM states "the American public has not benefited from the full potential of this energy resource, due to venting, flaring and leaks of significant quantities of gas during the production process."²⁶² "Federal and Indian onshore lessees and operators reported to the Office of Natural Resources Revenue (ONRR) that they vented or flared 462 billion cubic feet (Bcf) of natural gas between 2009 and 2015—enough gas to serve about 6.2 million households for a year, assuming 2009 usage levels."²⁶³ In 2015, operators increased the use of flaring with most of the releases being routine flaring of associated gas from development oil wells.²⁶⁴ More than 88% of the "flaring occurred in North Dakota, South Dakota, and New Mexico."²⁶⁵ If the oil and gas industry had to pay royalties based on all the gas they extract rather than the gas they transport to market, it would have an incentive to minimize waste. Such an approach would allow regulations to be simplified because market forces would encourage conservation of the resource.

The 2016 Waste Prevention rule "amends the BLM's oil and gas regulations at 43 CFR part 3160 to include requirements for a waste minimization plan"²⁶⁶ It "adds new subparts 3178 and 3179 to 43 CFR part 3170 [to] address royalty-free

265. *Id.*

266. *Id.* at 83,009.

use of lease production (subpart 3178) and waste prevention through reduction of venting, flaring and leaks (subpart 3179).”²⁶⁷ The BLM has considered and minimized potential overlaps with other federal, state, or tribal regulations because “overlapping regulatory regimes can create difficulties for operators”²⁶⁸ In addition, this rule authorizes the BLM to grant variances from particular requirements if a State or tribe demonstrates it imposes equally effective requirements.²⁶⁹

The Waste Prevention Rule is considered by BLM to be a necessary step to minimize waste of the public’s natural gas resources.²⁷⁰ Neither EPA nor the states have adequately addressed “the issue of waste of gas from BLM-administered leases.”²⁷¹ The EPA’s regulations focus on air pollution, not waste prevention.²⁷² “[T]hey cover only new, modified and reconstructed sources; and they do not address wasteful routine flaring of associated gas from oil wells”²⁷³ No State has established a comprehensive set of requirements addressing “venting, flaring and leaks—and only a few States have significant requirements in even one of these areas.”²⁷⁴

The Waste Prevention Rule focuses on venting and flaring of associated gas from oil wells, gas leaks from equipment, “operation of high-bleed pneumatic controllers and certain pneumatic pumps, gas emissions from storage vessels, downhole well maintenance and liquids unloading, and well drilling and completions.”²⁷⁵ This rule requires operators to reduce waste of gas.²⁷⁶ It establishes clear criteria for when flared gas will qualify as waste and be subject to royalties, and which on-site uses of natural gas are exempt from royalties.²⁷⁷

[B]eginning one year from the effective date of the final rule, operators must capture 85 percent of their adjusted total volume of gas produced each month. This percentage increases to 90 percent in 2020, 95 percent in 2023, and 98 percent in 2026. An operator’s adjusted total volume of gas produced is calculated based on the quantity of high pressure gas produced from the operator’s development oil wells that are in production, adjusted to exempt a specified volume of gas per well, which declines over time. Beginning one year from the effective date of the final rule, operators are allowed to exempt 5,400 Mcf gas per well per month,

277. *Id.*

and this quantity declines to 3,600 beginning in 2019, 1,800 in 2020, 1,500 in 2021, 1,200 in 2022, 900 in 2024, and 750 from 2025 on.²⁷⁸

It might be worth noting that at even the current depressed price of natural gas at about \$2.86 Mcf in July 2017, the oil and gas industry is allowed to avoid royalties on natural gas valued at over \$15,000 per month, per well.²⁷⁹

Operators have “the option to meet their capture targets on a lease-by-lease basis, or an average basis over all of their Federal or Indian production from development oil wells county-by-county or State-by-State,” which enhances flexibility and makes the targets less costly to meet.²⁸⁰ The flaring rule when fully implemented is expected to reduce methane releases up to 49% relative to 2015 levels.²⁸¹

The rule also “requires operators to submit a Waste Minimization Plan when they apply for a permit to drill a new development oil well.”²⁸² “While the provisions of a plan [are] not enforceable against the operator, plan submission is mandatory, and the plan must include specific elements [that are] listed in the regulations.”²⁸³ “[F]ailure to submit a complete and adequate plan could be grounds for denial of an application for a permit to drill (APD).”²⁸⁴

The Waste Prevention rule is under attack by the Republican-led Congress, which is discussed *infra* Section III(I).

C. Leaks

The BLM considers leaks to be “the second largest source of vented gas from Federal and Indian leases”²⁸⁵ “Leak Detection and Repair (LDAR) programs are [considered to be] a cost-effective means of reducing waste in oil and gas production, and . . . once leaks are detected, the vast majority can be repaired with a positive return to the operator.”²⁸⁶ “The final rule requires operators to use an instrument-based approach to leak detection.”²⁸⁷ “[O]perators [may] use optical gas imaging equipment, portable analyzers deployed according to the protocol prescribed in [the] EPA’s Method 21, or an alternative leak detection device approved by the BLM.”²⁸⁸ Operators are required to repair leaks “within 30 days of discovery, absent good cause, and verify that the leak is fixed.”²⁸⁹ “[R]ecords

documenting the dates and results of leak inspections, repairs, and follow-up inspections” must be kept.²⁹⁰

On December 8, 2017, following a thirty-day public comment period, the BLM finalized delays of the Waste Prevention Rule, which is the portion of the methane rule intended to minimize venting, flaring, and leaking.²⁹¹ This action drew new lawsuits filed on December 19th by the States of California and New Mexico, and a coalition of environmental groups.²⁹² The plaintiffs contend that the Trump Administration has violated the Mineral Leasing Act of 1920 requiring the prevention of natural resources waste.²⁹³ Also, the plaintiffs allege the Administration has again violated the Administrative Procedures Act as well as procedural requirements in the National Environmental Policy Act.²⁹⁴ In the final rule, the BLM explained that the compliance delays were necessary to give the agency time to propose a replacement rule.²⁹⁵

D. Pneumatic Controllers and Pumps

The BLM estimates that in 2014 its lessees “lost about 14.9 Bcf of natural gas from pneumatic controllers and about 2.3 Bcf from pneumatic pumps.”²⁹⁶ The final rule requires the replacement of “high-bleed pneumatic controllers with low-bleed or no-bleed pneumatic controllers within one year of the effective date of the final rule.”²⁹⁷ This requirement is based on the “requirements in Colorado and Wyoming (in part of the State), and it applies only to pneumatic controllers that are not covered by EPA regulations.”²⁹⁸

Operators must “replace pneumatic diaphragm pumps that operate 90 or more days per year with zero-emissions pumps, or route the pump exhaust gas to processing equipment.”²⁹⁹ If “routing the exhaust gas to processing equipment would be technically infeasible or unduly costly, the operator must route the pneumatic diaphragm pump to a combustor or flare, if one is located on the site.”³⁰⁰ “[T]he final rule does not apply to pneumatic pumps that are subject to EPA regulations.”³⁰¹ Moreover, “an exemption from the requirements for pneumatic controllers or pumps [is available] if the operator demonstrates and the BLM [agrees] that replacing the pneumatic pump(s) would impose . . . costs [that would]

cause the operator to [end] production and abandon significant recoverable oil reserves”³⁰²

E. Storage Vessels

The BLM estimates “that 2.94 Bcf of natural gas was lost in 2014 from storage tank venting on Federal and Indian lands.”³⁰³ Of that volume, about half was released from oil operations and half from natural gas operations.³⁰⁴ To control vapor releases will require either the installation of a vapor recovery unit (VRU) or the routing of the vapors to a flare or combustor.³⁰⁵ “New, modified and reconstructed vessels used in oil and gas production are already subject to EPA [requirements]” that mandate “at least a 95 percent reduction in VOC emissions from baseline levels.”³⁰⁶ “Colorado and part of Wyoming have similar, somewhat more stringent requirements for storage vessels.”³⁰⁷ Operators may “request an exemption from these requirements if the operator demonstrates, and the BLM [agrees], that [compliance] . . . would impose . . . costs [that] cause the operator to cease production and abandon significant recoverable oil reserves under the lease.”³⁰⁸

F. Drilling, Completion, and Related Operations

“The EPA requires new hydraulically fractured and refractured oil or gas wells to capture or flare gas that . . . would be released during drilling and completion operations.”³⁰⁹ The BLM also requires that waste of gas releases during these operations be minimized “by requiring operators to capture, use, flare, or inject the gas.”³¹⁰ Complying with the EPA’s requirements should meet the BLM requirements.³¹¹

G. Summary of Costs and Benefits

“[T]he BLM estimates that the benefits of this rule would outweigh its costs by a significant margin.”³¹² “The BLM estimates this rule will pose costs ranging from \$114-\$279 million per year (using a 7 percent discount rate to annualize capital costs) or \$110-\$275 million per year (using a 3 percent discount rate to annualize capital costs) over the next 10 years.”³¹³ “The engineering compliance costs

presented do not include potential cost savings from the recovery and sale of natural gas”³¹⁴

In its Regulatory Impact Analysis (RIA), the BLM estimated “that average costs for a representative small operator would increase by about \$55,200, which would result in an average reduction in profit margin of 0.15 percent”³¹⁵ The BLM estimates that the final rule would “reduce methane emissions by [roughly] 35% from the 2014 estimates”³¹⁶ The BLM estimates “this final rule will produce additional royalties of \$3-\$10 million per year (discounted at 7 percent) or \$3-\$14 million per year (discounted at 3 percent).”³¹⁷

H. Congressional Action

On February 3, 2017, the House passed House Joint Resolution 36 to rescind the BLM’s November 2016 methane venting and flaring rule.³¹⁸ The Senate version, S.J. Res. 11, was rejected on May 10, 2017 in a forty-nine to fifty-one vote in which three Republican members voted not to kill the Interior’s rule.³¹⁹ The vote is considered a defeat for the fossil-fuel industry and for groups linked to the Koch Brothers, but the defeat may be short-lived.³²⁰ The Senate vote was influenced by the expectation that the Department of the Interior will issue a new revised methane rule.³²¹ “In June [2017], the Interior Department suspended compliance with those parts of the rule that was not already in effect”³²² This led to another lawsuit on July 5, 2017, filed by the State of California and New Mexico, challenging the BLM’s effort to postpone the Waste Prevention Rule.³²³ California and New Mexico claim that the BLM lacks authority under Section 705 of the Administrative Procedure Act to postpone compliance dates after a rule has gone into effect.³²⁴ The U.S. District Court for the Northern District of California agreed with the plaintiffs’ that postponing implementation of a rule already in effect violated APA notice and comment requirements.³²⁵ Furthermore, BLM’s postponement decision

was arbitrary and capricious because the agency only considered the costs of the rule and did not give any weight the rule's benefits, such as decreased resource waste, air pollution, and enhanced public revenues.³²⁶

IV. STATE REGULATION OF VOCS AND METHANE

This section discusses the state laws to control the VOC and methane emissions of major oil and gas producing states located in the western United States: Utah, California, Colorado, New Mexico, and Wyoming. The 2014 production of natural gas in million cubic feet was 453,207 for Utah; 252,718 for California; 1,631,391 for Colorado; 1,180,808 for New Mexico; and 1,791,235 for Wyoming.³²⁷ Texas is the most important producer of natural gas with 7,953,343 million cubic feet.³²⁸ The states rank for natural gas production was Wyoming (6), Colorado (5), New Mexico (9), Utah (12), and California (15).³²⁹ The 2014 production of crude oil in thousand barrels was 40,905 for Utah; 204,269 for California; 95,192 for Colorado; 123,686 for New Mexico; and 76,078 for Wyoming.³³⁰ Texas is the most important producer of crude oil with 1,155,684,000 barrels.³³¹ North Dakota is second.³³² The rankings for crude oil production are California (3), New Mexico (4), Colorado (7), Wyoming (8), and Utah (11).³³³ Colorado and Wyoming are considered to be states with stringent air pollution control requirements, while Utah and New Mexico are considered to be relatively lax.³³⁴ Utah, however, is developing new regulations to control VOC, and other air pollutants, from existing oil and gas operations, but they have not yet been approved.³³⁵ The proposed regulations were approved by the Utah Air Quality Board for public comment on September 6, 2017. Methane is not expected to be directly regulated, but it is indirectly regulated through VOC emission limits.³³⁶ This is discussed *infra* Section IV(A)(iv).

In March 2015, the BLM finalized its rule concerning hydraulic fracturing (fracking) on public lands,³³⁷ but the rule never went into effect.³³⁸ In a successful

motion for a preliminary injunction brought by Wyoming, Colorado, Utah, North Dakota, the Ute Tribe, and industry groups, the U.S. District Court for the District of Wyoming blocked the implementation of the rule.³³⁹ The court held that the Energy Policy Act of 2005 limited the EPA's regulatory authority to hydraulic fracturing involving the use of diesel fuel.³⁴⁰ On June 21, 2016, the Wyoming Federal District Court held that the BLM lacked Congressional authority to promulgate the hydraulic fracturing rule.³⁴¹ On March 15, 2017, the Trump administration announced it would begin rescinding the rule.³⁴² This shifts much of the regulatory authority over fracking to the states. Similar efforts by the Trump Administration are being made to end environmental protection in general and to limit the regulation of the oil and gas industry.³⁴³ This is shifting the control of air pollution from the production and processing of oil and gas to the states.

The material that follows sketches the basic approach of five western states, and their regulation of air pollution, including methane emissions, from oil and gas production. It should be acknowledged that comparison of the state programs is difficult and can be misleading. While the applicable statutes and regulations can be analyzed, their implementation is more difficult to assess. The legal regimen for stationary sources of air pollution control is focused on major sources, but states usually treat most oil and gas emission sources as minor sources. This results in a lower level of attention being given to these sources. Moreover, minor sources are often regulated through individual permits. Such an approach gives substantial discretion to the state agency concerning what requirements to impose. Alternatively, general permits can be used to cover multiple oil and gas emission sources. Regardless of the stringency of a state's regulations, the level of enforcement can determine the effectiveness of the program. Most state air pollution enforcement efforts are woefully underfunded,³⁴⁴ which makes compliance largely dependent on the industry's willingness to meet emissions control requirements.

A. Utah

Utah has about 12,300 producing oil and gas wells.³⁴⁵ There were 8,583 producing natural gas wells in 2015.³⁴⁶ The major production of oil in 2016 was in

Duchesne, Uintah, and San Juan counties;³⁴⁷ the major production of natural gas in 2016 was in Uintah, with Carbon and Duchesne counties in a distant second and third place.³⁴⁸ Utah has three of the top one-hundred gas fields in the U.S.: Natural Buttes, Chapita Wells, and Red Wash.³⁴⁹ It has three of the top one-hundred oil fields: Monument Butte, Altamont-Bluebell, and Greater Aneth.³⁵⁰ Utah is the state with the fourth highest number of mineral leases on federal lands.³⁵¹

In Utah, approximately 90% of the active oil and gas wells are located in “Indian Country” where the state does not have regulatory authority over air emissions.³⁵² However, only about one-fourth of Utah’s crude oil production came from Indian lands in 2013.³⁵³ Regulation of oil and gas activities in Indian Country is the responsibility of EPA and the Indian tribes.³⁵⁴

Utah regulates air emissions from oil and gas operations based on its Administrative Code R307-501-1 to R307-501-4.³⁵⁵ The regulations apply to “natural gas exploration, product, and transmission operations; well production facilities; natural gas compressor stations; and natural gas processing plants . . .”

³⁵⁶ The regulations do not apply to oil refineries.³⁵⁷ The basic requirements are found in R307-501-4. General Provisions:

(1) General requirements for prevention of emissions and use of good air pollution control practices.

(a) All crude oil, condensate, and intermediate hydrocarbon liquids collection, storage, processing and handling operations, regardless of size, shall be designed, operated and maintained so as to minimize emission of volatile organic compounds to the atmosphere to the extent reasonably practicable.

(b) At all times, including periods of start-up, shutdown, and malfunction, the installation and air pollution control equipment shall be maintained and operated in a manner consistent with good air pollution control practices for minimizing emissions.

(c) Determination of whether or not acceptable operating and maintenance procedures are being used will be based on information available to the director, which may include, but is not limited to,

monitoring results, infrared camera images, opacity observations, review of operating and maintenance procedures, and inspection of the source.

(2) General requirements for air pollution control equipment.

(a) All air pollution control equipment shall be operated and maintained pursuant to the manufacturing specifications or equivalent to the extent practicable and consistent with technological limitations and good engineering and maintenance practices.

(b) The owner or operator shall keep manufacturer specifications or equivalent on file.

(c) In addition, all such air pollution control equipment shall be adequately designed and sized to *achieve* the control efficiency rates established in rules or in approval orders issued under R307-401 and to handle reasonably foreseeable fluctuations in emissions of VOCs during normal operations. Fluctuations in emissions that occur when the separator dumps into the tank are reasonably foreseeable.³⁵⁸

Utah has jurisdiction over lands outside of Indian Country. It subjects emission sources to its New Source Review (NSR) requirements if they have emissions greater than five tons per year of any criteria pollutant or greater than 500 pounds per year of any single hazardous air pollutant or 2,000 pounds per year of all hazardous air pollutants.³⁵⁹ However, most oil and gas emission sources do not meet the threshold for NSR applicability.³⁶⁰

Utah's Division of Air Quality has issued sixty-six operating permits to major sources based on Title V of the CAA.³⁶¹ Only nine permits have been issued to oil and gas operations—one to a natural gas processing plant and eight to compressor stations.³⁶² This means that nearly all the oil and natural gas facilities are regulated as minor sources, which are defined as sources that are not major.³⁶³ Minor sources have less stringent requirements than major sources but are required to obtain an approval order as provided in the Utah Administrative Code R307-401.³⁶⁴ Utah's Division of Air Quality website lists 1,547 approval orders issued since July 1, 2007.³⁶⁵ There are many pre-2007 approval orders, but they are not available in a

DAQ database.³⁶⁶ The DAQ has issued approval orders for approximately 920 oil and gas industry sources.³⁶⁷

i. Approval Orders

Utah Administrative Code R307-401 “establishes the application and permitting requirements for new installations and modifications to existing installations throughout the State of Utah.”³⁶⁸ There is an exemption in R307-401-9, discussed below, for small sources. Facilities located in nonattainment or maintenance areas have additional requirements that are found in R307-403, R307-405, R307-406, R307-410, R307-420, and R307-421.³⁶⁹

Sources must utilize the “Best available control technology” (BACT), which is defined at R307-401-2 as an:

[E]missions limitation (including a visible emissions standard) based on the maximum degree of reduction for each air pollutant which would be emitted from any proposed stationary source or modification which the director, on a case-by-case basis, taking into account energy, environmental, and economic impacts and other costs, determines is achievable for such source or modification through application of production processes or available methods, systems, and techniques, including fuel cleaning or treatment or innovative fuel combustion techniques for control of such pollutant. In no event shall application of best available control technology result in emissions of any pollutant which would exceed the emissions allowed by any applicable standard under 40 CFR parts 60 and 61. If the director determines that technological or economic limitations on the application of measurement methodology to a particular emissions unit would make the imposition of an emissions standard infeasible, a design, equipment, work practice, operational standard or combination thereof, may be prescribed instead to satisfy the requirement for the application of best available control technology. Such standard shall, to the degree possible, set forth the emissions reduction achievable by implementation of such design, equipment, work practice or operation, and shall provide for compliance by means which achieve equivalent results.³⁷⁰

R307-401 applies to any person intending to: “construct a new installation . . . or make modifications or relocate an existing installation . . . or install a control apparatus or other equipment intended to control emissions of air pollutants.”³⁷¹ Additional permitting requirements for new or modified sources may be imposed

366. See *id.*

367. E-mail from Alan Humpherys, Section Manager, Minor New Source Review, Utah DAQ, to author (May 12, 2017) (on file with author).

368. UTAH ADMIN. CODE r. 307-401-1.

369. *Id.*

370. UTAH ADMIN. CODE r. 307-401-2.

371. r. 307-401-3(1)(a)–(c).

based on R307-403, R307-405, and R307-406.³⁷² The “[e]xemptions contained in R307-401 do not affect applicability or other requirements under R307-403, R307-405 or R307-406,” and do not affect “applicability or other requirements under R307-401, unless specifically authorized.”³⁷³

R307-401-4 provides general requirements that “apply to all new and modified installations, including installations that are exempt from” needing an approval order.³⁷⁴ “[C]ontrol apparatus installed on an installation [must be] adequately and properly maintained.”³⁷⁵ An exempted installation that is not meeting an approval order or State Implementation Plan limitation may be required to “submit a notice of intent and obtain an approval order in accordance with R307-401-5 through R307-401-8.”³⁷⁶

A person subject to R307-401-5 must submit a notice of intent to the director of the Division of Air Quality “and receive an approval order prior to initiation of construction, modification or relocation.”³⁷⁷ “The notice of intent shall be in a format specified by the director.”³⁷⁸ The regulation specifies the content of the notice of intent.³⁷⁹ The applicant must receive an approval order prior to construction, modification, or relocation.³⁸⁰

The content of the approval order is specified in R307-401-8. Emissions, including fugitive emissions and fugitive dust, must use best available control technology (BACT).³⁸¹ “[F]or a new or modified source in an ozone nonattainment or maintenance area that will emit volatile organic compounds or nitrogen oxides,” BACT shall be at least as stringent as any EPA Control Technique Guidance document that is applicable to the source.³⁸² It must also meet the following: any requirements applicable to new and modified sources in nonattainment and maintenance areas; PSD requirements including visibility requirements; ozone offset requirements in Davis and Salt Lake Counties; new source performance standards; national emission standards for hazardous air pollutants; and all requirements of the Utah State Implementation Plan.³⁸³ Moreover, all pollution control equipment must be adequately and properly maintained.³⁸⁴ “If the director determines that a proposed stationary source, modification or relocation does not meet the conditions” for an approval order it may not be issued.³⁸⁵

A small stationary source is exempted by R307-401-9 from the requirement to obtain an approval order if the following conditions are met:

372. UTAH ADMIN. CODE r. 307-401-3(2).

373. r. 307-401-3(2)(a)–(b).

374. r. 307-401-4.

375. r. 307-401-4(1).

383. r. 307-401-8(1)(b)(i)–(x).

384. UTAH ADMIN. CODE r. 307-401-8(2).

385. r. 307-401-8(5).

(a) its actual emissions are less than 5 tons per year per air pollutant of any of sulfur dioxide, carbon monoxide, nitrogen oxides, PM₁₀, ozone, or volatile organic compounds;

(b) its actual emissions are less than 500 pounds per year of any hazardous air pollutant and less than 2000 pounds per year of any combination of hazardous air pollutants;

(c) its actual emissions are less than 500 pounds per year of any air pollutant not listed in (a) or (b) above and less than 2000 pounds per year of any combination of air pollutants not listed in (a) or (b) above.

(d) Air pollutants that are drawn from the environment through equipment in intake air and then are released back to the environment without chemical change, as well as carbon dioxide, nitrogen, oxygen, argon, neon, helium, krypton, xenon should not be included in emission calculations when determining applicability under (a) through (c) above.³⁸⁶

A source that is exempted from the requirement to obtain an approval order “shall no longer be exempt if actual emissions in any subsequent year exceed the emission thresholds”³⁸⁷ “The director will maintain a registry of sources that are claiming an exemption under R307-401-9.”³⁸⁸ “A stationary source that is not required to obtain a permit under R307-405 for greenhouse gases, as defined in R307-405-3(9)(a), is not required to obtain an approval order for greenhouse gases under R307-401.”³⁸⁹ “The owner or operator of a stationary source of air pollutants that reduces or eliminates air pollutants [may be] exempt from the requirement to submit a notice of intent and obtain an approval order prior to construction.”³⁹⁰

Approval orders issued by the director in accordance with the provisions of R307-401 [must be] reviewed eighteen months after the date of issuance to determine the status of construction, installation, modification, relocation or establishment. If a continuous program of construction, installation, modification, relocation or establishment is not proceeding, the director may revoke the approval order.³⁹¹

ii. General Approval Orders

In November 2013, a rule was approved that provides for general approval orders (GAOs).³⁹² A GAO is an alternative to the standard approval order for similar new or modified sources in a specified source category or for specific types of equipment depending on the regulations promulgated for a source category.³⁹³ A

393. r. 307-401-19(1).

GAO may apply throughout the state or can be limited to a specific area.³⁹⁴ To obtain a GAO, an applicant must meet all applicable requirements of R307-401-8.³⁹⁵ This includes the need to utilize BACT and provide a representative impact analysis. The director may require any source that has applied for a GAO to submit a notice of intent and obtain an individual approval order if the director determines that the source does not meet the criteria specified in the GAO rule, if modifications were made to the source that were not authorized by the GAO, or if a source is violating the law.³⁹⁶ “A source may make modifications only as authorized by the approved general approval order. Modifications outside the scope authorized by the approved general approval order shall require a new application for either an individual approval order under R307-401-8 or a general approval order under R307-401-19.”³⁹⁷

Utah’s Division of Air Quality has developed this program for the oil and gas industry.³⁹⁸ But, as of May 2017, only one GAO has been issued to an oil and gas industry source.³⁹⁹ Crude Oil and Natural Gas Well Site and Tank Battery GAOs are available for facilities that process up to 50,000 barrels of crude oil and condensate combined per year.⁴⁰⁰ Storage tanks must route volatile organic compounds (VOCs) to a process unit where they are recycled, incorporated into a product, or destroyed.⁴⁰¹ Maximum “tank capacity is limited to 550 barrels, and the maximum site-wide tank capacity is limited to 2,200 barrels.”⁴⁰² VOC and HAP emissions from dehydrators and natural gas-driven pneumatic pumps have similar control requirements.⁴⁰³ “Any VOC control device [must] have a minimum control/destruction efficiency of 98 percent[]” and operate with no visible emissions.⁴⁰⁴ Natural gas driven pneumatic “controllers must either be low bleed or have VOC emissions controlled.”⁴⁰⁵ Stationary engines, boilers, and heaters must use natural gas or liquefied petroleum gas (LPG) as fuel.⁴⁰⁶ A leak detection and repair program that meets the EPA’s requirements is required.⁴⁰⁷

iii. Compliance

Utah oil and gas operation compliance is regulated by the Department of Environmental Quality, Division of Air Quality, and the Department of Natural Resources, Division of Oil, Gas and Mining. The Division of Oil, Gas and Mining (DOGM) made 8,758 well inspections in 2016.⁴⁰⁸ However, DOMG and its Board do not regulate air emissions. It does have jurisdiction over flaring in order to preserve the resource, but no order allowing or limiting flaring has ever been issued based on air quality issues.⁴⁰⁹

Most air pollution compliance activities involving the oil and gas industry are the responsibility of Utah DAQ's Minor Source Compliance Section, which has three full-time inspectors assigned to oil and gas operations.⁴¹⁰ During the 2016 fiscal year, there were 114 full-compliance evaluations.⁴¹¹ These evaluations involve pre-inspection preparation, followed by an unannounced site inspection.⁴¹² At the site, each piece of equipment listed in the permit is inspected and visible emission observations are made at emission points.⁴¹³ An Infrared (IR) camera is used to search for VOC leaks.⁴¹⁴ This is followed by a post-inspection meeting with a representative of the facility at which the source's need for further action, if any, is discussed.⁴¹⁵

If there are compliance issues, a compliance advisory letter is sent to the source, and additional information may be requested.⁴¹⁶ If it is determined that the source is violating an applicable requirement, a settlement agreement is issued and the source must act to bring the facility into compliance.⁴¹⁷ In 2015, ten early settlement agreements with sanctions were issued, and in 2016, there were 21 such agreements.⁴¹⁸ Violations included the use of un-permitted equipment, exceeding production limits, poor maintenance, and VOC leaks.⁴¹⁹ The penalties imposed ranged from \$359 to \$10,000, with the majority of the penalties below \$1000.⁴²⁰ There have been no civil or criminal enforcement actions in the past five years.⁴²¹

iv. Proposed Permit Changes

Oil and gas sources are primarily minor sources or exempt sources under Utah rules. They make up over half the minor source permit requests received by Utah's DAQ.⁴²² Because of the nature of the oil and gas industry, the permits that are issued are virtually identical.⁴²³ For this reason, the Utah Air Quality Board on September 6, 2017, approved for public comment a number of proposed changes to the permitting process.⁴²⁴ The proposal would replace the existing source-by-source permitting process with a permit-by-rule (PBR) system.⁴²⁵ To implement PBR, DAQ has proposed new rules and amendments to a number of existing rules.⁴²⁶ The PBR will apply statewide and will require BACT that currently applies to sources that require new source review (NSR) permits.⁴²⁷ An important part of the proposed rules is the requirements in R307-150-1 that will require emission inventory reports from most small sources. However, there are exemptions from new technology-based requirements for sources that already have approval orders.⁴²⁸

B. California

California has more than 50,000 active oil wells, "about 1,500 active natural gas wells, and nearly 500 underground natural gas storage wells[,] although about ninety percent of its natural gas comes from other states."⁴²⁹ It also has 215,000 miles of natural gas pipelines for transmission and distribution, twenty-two compressor stations, and 25,000 metering and regulating stations.⁴³⁰ California regulates air pollution at the state level through its Air Resources Board, but much of the regulation of the oil and gas industry is the responsibility of local air districts, which regulate stationary sources.⁴³¹ There are thirty-five local air districts in California.⁴³² These districts regulate VOCs and NO_x emissions to control ground-level ozone.⁴³³ These controls reduce the associated methane emissions, but the local districts do not directly regulate methane.⁴³⁴

434. *Id.*

In July 2016, the California Air Resources Board (CARB) proposed a state rule that would reduce methane emissions from oil and natural gas facilities by forty-five percent over nine years.⁴³⁵ The proposed regulation requires vapor collections from various sources of oil and gas operations.⁴³⁶ It requires leak detection and repair.⁴³⁷ It requires “no bleed” pneumatic devices and pumps.⁴³⁸ It requires the development of a methane monitoring program.⁴³⁹ This regulation builds on the programs of some existing air pollution control districts but covers many components not covered by local district programs.⁴⁴⁰

On March 23, 2017, CARB approved a new methane regulation that will be phased in between 2018 and 2020.⁴⁴¹ The aim is to reduce the 118 Million Metric Tons CO_{2e} (MMTCo_{2e}) of methane to 71 MMTCo_{2e} by 2030, which is a forty percent reduction.⁴⁴² The regulation limits both “intentional . . . and unintentional . . . emissions from active and idle equipment and operations.”⁴⁴³ It has leak detection and repair requirements that include daily inspections and quarterly leak testing.⁴⁴⁴ It has requirements for vapor control and enhanced monitoring and reporting requirements.⁴⁴⁵

California is also moving to create new regulations to control underground storage facilities.⁴⁴⁶ On July 8, 2016, California’s Department of Conservation, Division of Oil, Gas, and Geothermal Resources, released a pre-rulemaking draft regulation to update its gas storage program.⁴⁴⁷ The California Public Utility Commission is working to adopt rules to prevent gas leaks from the transmission, distribution, and storage processes as directed by Senate Bill 1371.⁴⁴⁸

The oil and gas sector in California is responsible for four percent of the methane emissions. The new methane rule, when combined with the regulations by the California Public Utilities Commission governing transport, is expected to reduce methane emissions from the oil and gas industry by fifteen percent.⁴⁴⁹ On

449. *Id.*

June 15, 2017, the California Public Utilities Commission adopted the Natural Gas Leak Abatement Program, which augments a 2017 CARB rule designed to reduce methane emissions from oil and gas production facilities by forty percent below 2013 levels by 2030.⁴⁵⁰ In addition, oil and gas wells in California are subject to the Department of Conservation, Division of Oil, Gas & Geothermal Resources rules governing the drilling, operation, and maintenance related to oil and gas operations.⁴⁵¹

California's thirty-five Air Pollution Control Districts (APCD) and Air Quality Management Districts (AQMD) have most of the authority over stationary sources of air pollution.⁴⁵² One of the most active districts is the South Coast Air Quality Management District (SCAQMD) that covers the Los Angeles area.⁴⁵³ Its rules include § 1148—Thermally Enhanced Oil Recovery Wells; § 1148.1—Oil and Gas Production Wells; and § 1149—Storage Tank and Pipeline Cleaning and Degassing. Rule 1148.1 requires reductions in VOCs, Toxic Air Contaminants (TAC) and Total Organic Compounds (TOC).⁴⁵⁴ The District's rules to limit emissions of VOCs also reduce methane emissions that are mixed with VOC emissions. These rules are applicable "to onshore producing wells, well cellars, and produced gas handling operations . . . where petroleum and processed gas are produced, gathered, separated, processed, and stored."⁴⁵⁵ On July 7, 2017, the SCAQMD imposed higher fees on unplanned and repeat flaring events.⁴⁵⁶ The updated rule has more stringent notification requirements and new emissions factors for vented gases and includes the EPA's most recent requirements concerning flaring.⁴⁵⁷ The rule applies to eight oil refineries and four other sources in the Los Angeles area.⁴⁵⁸

C. Colorado

In Colorado, crude oil production quadrupled from 2010 to 2015 and then decreased somewhat in 2016 as crude oil prices declined.⁴⁵⁹ Substantial oil production comes from the Denver-Julesburg area in northeastern Colorado, which results in the second highest VOC emissions in the western states that are discussed in this article.⁴⁶⁰ The other important oil and gas production area is the Piceance

Basin in western Colorado.⁴⁶¹ Both of these oil-producing areas have substantial natural gas production as well.⁴⁶² Additional natural gas production comes from the San Juan Basin, which extends into New Mexico.⁴⁶³ In 2017, Colorado had 23,279 active producing oil and gas wells.⁴⁶⁴

Oil and gas operations are regulated by the Colorado Oil and Gas Conservation Commission (COGCC).⁴⁶⁵ Air quality regulations are adopted by the Air Quality Control Commission and are administered by the Air Pollution Control Division (APCD) within the Department of Public Health and Environment.⁴⁶⁶ Construction permits are required for new or modified sources with emissions above specified thresholds.⁴⁶⁷ VOC and NO_x have emission limits based on whether the location is nonattainment or attainment or maintenance areas.⁴⁶⁸ Minor sources must install Reasonably Available Control Technology (RACT).⁴⁶⁹ Existing oil and gas production equipment is subject to regulation for ozone precursors.⁴⁷⁰ Colorado's emission regulations for controlling VOCs from oil and gas operations include oil and gas production operations, natural gas compression stations, and natural gas drip stations (aka natural gas condensate: white gas).⁴⁷¹

On February 23, 2014, Colorado became the first state to address methane emissions from the oil and gas industry in addition to the previously regulated VOCs.⁴⁷² Key elements of the Colorado rule were subsequently adopted by Wyoming. The rule was enacted by Colorado's Air Quality Control Commission (AQCC) with the support of three of the state's largest producers: Anadarko Petroleum, Noble Energy and Encana, and numerous environmental groups, but it was opposed by the Colorado Oil and Gas Association and the Colorado Petroleum Association.⁴⁷³ It is projected to reduce VOCs and methane equal to the emissions of all cars and trucks in Colorado.⁴⁷⁴

474. Whittenberg & Omens, *supra* note 472.

The Colorado AQCC added methane to its list of regulated pollutants by approving a new Regulation Number 7, codified at 5 CCR § 1001-9.⁴⁷⁵ It replaced the prior rule's use of the term VOC with the term hydrocarbons, which has the effect of making methane a regulated pollutant.⁴⁷⁶ Section 1001-9 includes a number of subsections applicable to the oil and gas industry, particularly subsection XII (Volatile Organic Compound Emissions from Oil and Gas Operations).⁴⁷⁷ In addition, AQCC Regulation Number 6, codified at 5 CCR § 1001-5, adopts EPA's NSPS for the oil and gas industry.⁴⁷⁸ However, the Colorado rules in 5 CCR § 1001-8 impose additional requirements beyond the EPA's, and they are enforceable based on Colorado law.⁴⁷⁹

Section 1001-9 requires emissions of hydrocarbons to be reduced by ninety-five percent from centrifugal compressors, new and recompleted wells, glycol natural gas dehydrators, and storage tanks—with various phase-in dates.⁴⁸⁰ It also requires emissions to be reduced from venting and flaring.⁴⁸¹ It requires companies to detect leaks and repair them and to capture ninety-five percent of VOC and methane emissions.⁴⁸² To implement the new requirements, the rule adds more stringent inspection requirements.⁴⁸³

In 2012, Colorado APCD had eight inspectors that focused on the oil and gas sector, and COGCC employed 16 field inspectors to supervise more than 49,000 active oil and gas wells.⁴⁸⁴ To inspect each well once a year would require each inspector to evaluate a well about every hour of the work year. How inspectors will evaluate compliance with these complex regulations aimed at myriad components used in the oil and gas processing with the state governments limited personnel and resources is a mystery.

D. New Mexico

New Mexico is the eighth most important supplier of net energy in the United States.⁴⁸⁵ It is the state that has the second highest number of oil and gas leases on federal land.⁴⁸⁶ Its San Juan Basin in the northwest corner and the Permian Basin in the southeast, which straddles Texas and New Mexico, are two of the most

important oil and gas fields in the U.S.⁴⁸⁷ In 2015, the state had 40,578 producing natural gas wells.⁴⁸⁸ The Permian Basin may become even more important because, in February 2017, ExxonMobil paid almost \$6 billion for drilling rights to over 275,000 acres in the Basin.⁴⁸⁹ Exxon's XTO Energy, Inc. will deploy fifteen new rigs with the goal of producing a twenty percent per year increase in crude oil output from its properties through 2025.⁴⁹⁰ Between May 2016 and January 2017, more than half the horizontal drilling rigs in the U.S. were deployed to the Permian Basin.⁴⁹¹

The oil and gas industry in New Mexico is subject to regulations issued by the Oil Conservation Commission (OCC).⁴⁹² The regulations are administered by the state's Oil Conservation Division (OCD) within the Minerals and Natural Resources Department.⁴⁹³ The OCD is minimally funded and has about fourteen inspectors to supervise compliance from about 60,000 wells.⁴⁹⁴ OCD can use Rule 5.9 to essentially put the operator out of business by denying an operator permits to drill new wells, transport oil, and inject waste water underground.⁴⁹⁵ However, OCD's enforcement power to deal with less serious violations was limited by New Mexico's Supreme Court in the 2009 decision of *Marbob Energy Corp. v. New Mexico Oil Conservation Commission*.⁴⁹⁶ Marbob Energy, an oil and gas producer, challenged New Mexico Administrative Code § 19.15.14.1227 giving the OCC and the OCD the authority to assess civil penalties and impose other sanctions for violations of the Oil and Gas Act.⁴⁹⁷ The District Court affirmed the order and the case eventually went to the State's Supreme Court.⁴⁹⁸

The New Mexico Supreme Court held that the specific provisions of "[s]ection 70-2-28 require that the Attorney General . . . bring an action in court to assess civil penalties for violations of the Act, and [any associated] rules, orders, and regulations . . ."⁴⁹⁹ "The Commission was created by Section 70-2-4 of the [Oil and Gas] Act and has two primary duties regarding the conservation of oil and gas:

prevention of waste and protection of correlative rights.”⁵⁰⁰ The OCC may also make rules and regulations to implement and enforce the Act.⁵⁰¹ The OCD was given authority to regulate by the Commission on November 10, 2005.⁵⁰² However, the Supreme Court held that OCD did not have authority under Act to impose civil penalties.⁵⁰³

The parties’ dispute involved conflicting interpretations of the statute.⁵⁰⁴ According to Marbob, Section 70-2-28 mandated that the Attorney General bring suit to assess the penalties.⁵⁰⁵ The only penalty provision that directly concerned this case was Section 70-2-31(A), which provides that “[a]ny person who knowingly and willfully violates any provision of the Oil and Gas Act . . . or any provision of any rule or order issued pursuant to that act shall be subject to a civil penalty of not more than one thousand dollars (\$1,000) for each violation.”⁵⁰⁶ The Commission argued that the OCD and the Commission may assess penalties by virtue of the broad statutory authority granted to them in Sections 70–2–6 and –11 to enforce the Act.⁵⁰⁷

The court agreed with Marbob that the Attorney General is to establish liability and assess the civil penalties authorized under the Act based on the plain language of the statute.⁵⁰⁸ The result of this case was to make it nearly impossible to enforce oil and gas regulations. The under budgeted and understaffed OCD had to forward any civil penalty case to the Attorney General’s Office.⁵⁰⁹ Because civil penalties were limited to \$1,000 per violation, these cases were a low priority for the use of the finite budget of the prosecutors.⁵¹⁰ It has been reported that such cases are rarely brought.⁵¹¹

Subsequently, the New Mexico legislature increased the civil penalty provision to a maximum of \$15,000 per day for violation of an air quality regulation, a permit condition, or an emergency order, but civil penalties continue to be enforceable only by the Attorney General’s Office.⁵¹² New Mexico’s Legislature also added section 74-2-12 that provides for the issuance of a compliance order for violation of the Air Quality Control Act.⁵¹³ Violation of a compliance order can lead to a penalty of up to \$15,000 a day.⁵¹⁴ In addition, a field citation program provides for civil penalties up to \$1,000 per day of violation.⁵¹⁵ The statutes also provide for criminal

penalties that may include a fine of up to \$10,000 per day or imprisonment for up to 18 months, or both.⁵¹⁶

The New Mexico Environment Department (NMED) is responsible for protecting and restoring New Mexico's environment.⁵¹⁷ It has a Petroleum Storage Bureau within the NMED that has a mandate to reduce, mitigate and eliminate releases of petroleum products from storage tanks.⁵¹⁸ Air quality is the responsibility of the Air Quality Bureau within NMED.⁵¹⁹ It engages in strategic planning, issues air quality construction and operating permits, ensures compliance and participates in the usual activities of a state air pollution control agency.⁵²⁰ It has statewide jurisdiction except for Bernalillo County and Tribal Lands.⁵²¹ Its authority is provided by New Mexico statutes, Title 74, Chapter 2.⁵²²

Section 74-2-5 provides for the Environmental Improvement Board to prevent or abate air pollution, and it gives the Board rulemaking authority.⁵²³ Section 74-2-5.3 gives the Board the power to regulate emissions that cause or contribute to ozone concentrations that exceed ninety-five percent of the national ambient air quality standards (NAAQS) for the ozone.⁵²⁴ This limits the areas subject to the Board's regulatory authority. Regulations to implement the air pollution laws are found in the New Mexico Administrative Code 20.2.⁵²⁵ There are almost no regulations specifically aimed at the oil and gas industry. One exception is section 20.2.38, which deals with the control of hydrocarbon storage facilities.⁵²⁶ Section 20.2.100, dealing with the state's greenhouse gas reduction program was repealed.⁵²⁷

E. Wyoming

In 2015, Wyoming had 25,279 producing natural gas wells.⁵²⁸ Wyoming ranked eighth in the nation in crude oil production, and it ranked fourth in natural gas production in 2013.⁵²⁹ Campbell County, followed by Converse and Park Counties, were the leading oil producers.⁵³⁰ Sublette County was the leading

producer of natural gas, followed by Sweetwater and Johnson Counties.⁵³¹ The Pinedale field was the most productive natural gas field.⁵³² Wyoming has 2.5% of the nation's petroleum reserves and 10.6% of its dry natural gas reserves.⁵³³

Wyoming's laws dealing with oil and gas operations are found in the Wyoming Code, Title 30, Chapter 5.⁵³⁴ The Wyoming Oil and Gas Conservation Commission (WOGCC) issues drilling permits and enforces the oil and gas laws and regulations.⁵³⁵ It issues regulations and orders pursuant to the authority provided by Wyoming Statute section 30-5-104(c) & (d). WOGCC has issued numerous guidelines and policy statements, including information on best management practices related to oil and gas operations.⁵³⁶ Their operating permit requirements apply to any source as defined in the regulations.⁵³⁷ The Jonah Interagency Mitigation and Reclamation Office (JIO), a subsidiary of BLM, provides management assistance for the Jonah Natural Gas Field.⁵³⁸ The Powder River Interagency Working Group coordinates the permitting and monitoring of natural gas development in the Powder River Basin.⁵³⁹

Wyoming law provides for the WOGCC to seek an injunction and civil penalties for the violation of any provision of the statute or regulation through a suit brought in the appropriate district court.⁵⁴⁰ Penalties are up to \$5,000 per day of violation, but knowing and willful violations can result in a civil penalty up to \$10,000 per day.⁵⁴¹ Any person that makes a false report is guilty of a misdemeanor and can face up to a \$5,000 fine or imprisonment for up to six months, or both.⁵⁴² Any person or corporation violating the statute, rules or a lawful order shall upon conviction be fined up to \$500 or be imprisoned for up to six months.⁵⁴³ A violation of Wyoming Statute 30-5-119 involving the excess flaring of natural gas subjects the violator to an additional penalty, ten percent of the civil penalty or 6.25% of the value of the gas flared or vented, whichever is greater.⁵⁴⁴ Wasting natural gas, by burning or venting it without properly using the gas it is prohibited.⁵⁴⁵ Wasting natural gas is a misdemeanor and is punishable by a fine of up to \$1,000 per day of violation.⁵⁴⁶

Air quality regulations are promulgated by Wyoming's Environmental Quality Council and are administered by the Wyoming Air Quality Division (WAQD).⁵⁴⁷ Permit requirements are found in chapter 6 with § 2 dealing with permits for construction and modifications of existing facilities and § 3 dealing with operating permits.⁵⁴⁸ Much of the oil and gas industry, however, does not meet the emissions threshold to be subject to the requirements applicable to major sources. WAQD has issued *Oil and Gas Production Facilities Chapter 6, Section 2 Permitting Guidance*, which helps explain the applicable air quality standards and regulations.⁵⁴⁹ In addition to WAQD requirements, the Wyoming regulations incorporate by reference the federal requirements imposed by the Code of Federal Regulations (CFRs).⁵⁵⁰

Chapter 1, § 7 establishes a greenhouse gas permitting program with requirements found in chapter 6, §§ 3 and 4.⁵⁵¹ Preconstruction permits are required for greenhouse gas sources that are subject to the PSD requirements of chapter 6, § 4.⁵⁵² This allows most oil and gas production facilities to avoid GHG requirements because their emissions are below the trigger point for PSD permitting. Sources that emit greenhouse gases may be subject to operating permit requirements.⁵⁵³ Operating permits are required for sources that are major based on CAA §§ 111 or 112.⁵⁵⁴ Major sources are defined as those with the potential to emit 100 tons per year (tpy) or more of any air pollutant or 10 tpy of any HAP or 25 tpy of aggregated HAPs.⁵⁵⁵ However, the regulations limit the ability of the government to aggregate emissions from the oil and gas industry.⁵⁵⁶ This results in few oil and gas activities being subject to the need for a CAA title V operating permit.

VOC sources are subject to BACT requirements.⁵⁵⁷ Flares cannot exceed 20% opacity.⁵⁵⁸ If a smokeless flare is required, visible emissions are limited to five minutes during any two consecutive hours.⁵⁵⁹

Nonattainment areas are subject to specific additional regulatory requirements and are required to submit emission inventories.⁵⁶⁰ The Upper Green River Basin, in western Wyoming, which includes Sublette County and parts of Sweetwater and Lincoln Counties, has been the highest emitter of VOCs in the western states that are the subject of this article.⁵⁶¹ It was designated

nonattainment for ozone in 2012.⁵⁶² In May 2015, the Wyoming Environmental Quality Council approved a new rule to regulate oil and gas emissions in the Upper Green River Basin (UGRB).⁵⁶³ The rule imposes requirements on the oil and gas production facilities and compressor stations located in the UGRB.⁵⁶⁴ Production facilities with VOC emissions equal to or greater than 4 tpy must have controls with ninety-eight percent destruction efficiency.⁵⁶⁵ Fugitive emissions of VOCs also are restricted.⁵⁶⁶

In 2013 Wyoming's Air Quality Division had two permit engineers who processed about 200 construction permits a year for oil and gas facilities.⁵⁶⁷ It had about 10 emissions inspectors to handle the thousands of well sites in the state.⁵⁶⁸

V. STATE TAXATION OF OIL AND GAS OPERATIONS

Approximately thirty-one states have a tax on the extraction of oil and gas.⁵⁶⁹ These states with oil and gas resources have a conflicting relationship with the industry. On the one hand, they regulate the industry, and the more stringent the regulations the greater the effect on the viability of the industry. On the other hand, the states are partners with the industry based on their use of the taxation power to share in the industry's profits. Western states that have a robust oil and gas industry depend on the taxes generated by these businesses for much of their states' revenue. The most important tax is the severance tax or production tax. For example, in 2013, when petroleum prices were high, severance tax collections were \$2,460 million in North Dakota, \$870 million in Wyoming, \$710 million in New Mexico, \$280 million in Montana, \$150 million in Colorado, \$110 million in Utah, and \$40 million in California.⁵⁷⁰ Unfortunately, these revenues are subject to the boom and bust nature of the industry. For example, in the San Juan Basin of New Mexico in June 2014, when oil was about \$90 a barrel the value of the oil sold was \$84,520 and the taxes paid to the state and local governments was \$5,961.⁵⁷¹ Less than a year later, in February 2015, oil was selling for about \$38 a barrel.⁵⁷² The value of the oil sold dropped to \$28,120 and the taxes paid dropped to \$1,993.⁵⁷³ In 2008 New Mexico's revenue from oil and natural gas was \$1,227,668,013; in 2010, it dropped to \$804,337,303.⁵⁷⁴

572. *Id.*

573. *Id.*

574. Richard Anklam & Deborah Seligman, *Oil and Natural Gas Taxing in New Mexico*, N.M. TAX RES. INST., 14,

There is a significant difference in the state tax rates applicable to the oil and gas industry. The oil and gas production tax rate is 11.7% in Wyoming, 11.2% in North Dakota, 7.6% in Montana, 6.9% in New Mexico, 6.8% in Colorado, and 3.3% in Utah.⁵⁷⁵ However, focusing on the production tax rate can be misleading. Some states apply the tax rate to a subset of production, and some states impose multiple taxes.⁵⁷⁶ States may allow local governments to tax oil and gas operations through property taxes, which shifts the benefits of taxation to the areas most impacted by the industry.⁵⁷⁷ There is evidence that state-level taxes are two-thirds higher in states that exclude oil and gas wells from local property taxes.⁵⁷⁸ Taxes can be imposed on the value of the oil and gas or can be imposed on the amount of production.⁵⁷⁹ One approach to enable comparison of production taxes among states is to compare the severance tax dollars received by the state to the Btu value of the fuel produced.⁵⁸⁰ In 2013 the dollars per MMBtu received was \$0.01 for California, \$0.10 for Colorado, \$0.47 for New Mexico, \$0.13 for Utah, and \$0.24 for Wyoming.⁵⁸¹ However, this only shows the effect of one of the taxes.

In Utah, there are three taxes or fees on the oil and gas industry.⁵⁸² There is a conservation fee of 0.002 multiplied by the value of oil and gas produced and saved, sold, or transported from the field in Utah.⁵⁸³ There is a severance tax with sliding scale rates based on the value of the oil and gas.⁵⁸⁴ It is 3% for the first \$13 of value per barrel for oil and 5% for the value above \$13.⁵⁸⁵ For natural gas, the tax is 3% for the first 1.50 Mcf and 5% for the value above 1.50 Mcf.⁵⁸⁶ The law provides various exemptions and tax credits.⁵⁸⁷ There is also a county ad valorem property tax that varies by county.⁵⁸⁸

In Wyoming, two taxes are imposed.⁵⁸⁹ There is a severance tax of up to 6% of the fair market value of the oil or gas produced.⁵⁹⁰ There is also an ad valorem tax on the value of the oil or gas produced in the prior year, which varies because it

includes county and local taxes.⁵⁹¹ Colorado has the second lowest effective severance tax at 1.7% of the nine Western states.⁵⁹² Only Utah has a lower rate.⁵⁹³

Colorado has a severance tax based on gross income that increases from 2% to 5% for income of \$300,000 and over.⁵⁹⁴ In 2015, Colorado firms paid a little over half what Wyoming firms paid on nearly identical production because of Colorado's generous deductions and tax credits.⁵⁹⁵ Montana imposes an oil and gas production tax that varies between 9% and 14.8% for qualified natural gas production and between 9% and 12.5% for primary oil production.⁵⁹⁶ North Dakota imposes a 5% tax on the gross value at the well of oil produced in the state with some adjustments if the price of oil increases substantially.⁵⁹⁷ Natural gas in fiscal year 2017 is taxed at \$0.0601 per Mcf of gas produced.⁵⁹⁸ New Mexico has a natural gas processing tax that is imposed on the amount of MMBtus of natural gas delivered to a processing plant.⁵⁹⁹ It has an oil and gas production equipment ad valorem tax based on 27% of the value of products for each production unit with a rate based on the local property tax.⁶⁰⁰ It has an oil and gas severance tax of 3.75% of the value of the oil or natural gas, an oil and gas conservation tax, and an oil and gas emergency school tax, and an oil and gas ad valorem production tax.⁶⁰¹ These taxes change each year.⁶⁰²

VI. CONCLUSION

The Republican Party supports policies that increase domestic energy production including production on public lands.⁶⁰³ Methane, the subject of this article is an important GHG, but the Party's official position is climate change "is far from this nation's most pressing national security issue. This is the triumph of extremism over common sense, and Congress must stop it."⁶⁰⁴ The Party proposes

“to shift responsibility for environmental regulation from the federal bureaucracy to the states and to transform the EPA into an independent bipartisan commission similar to the Nuclear Regulatory Commission.”⁶⁰⁵ President Trump appointed Scott Pruitt as the EPA’s Administrator.⁶⁰⁶ When Administrator Pruitt was Oklahoma’s Attorney General he worked closely with the energy industry to prevent the environmental regulation of oil and gas, which included opposing the regulation of methane.⁶⁰⁷ Because both President Trump and Administrator Pruitt seek to expand oil and gas production⁶⁰⁸ and have a well-documented antipathy toward efforts to protect the environment, it will be difficult to develop more stringent federal regulations to control methane in this administration.⁶⁰⁹

The Republican majority in Congress has used the Congressional Review Act (CRA) to override regulations enacted to protect the environment.⁶¹⁰ The CRA allows Congress, by a majority vote to strike down recently issued regulations, which then prevents agencies from issuing substantially similar regulations without express authorization from Congress.⁶¹¹ By April 3, 2017, the CRA has been used to nullify fourteen rules issued under the Obama Administration.⁶¹² However, as previously discussed, the effort to use the CRA to rescind the Methane Rule was rejected by the Senate.⁶¹³ Other more established regulations that are not subject to the CRA can be expected to be the focus of new rulemaking efforts to weaken the regulations. Thus, it is likely that oil and gas producing states will play a more important role in the control of air emissions, including GHG emissions, from the oil
