**LEARNING FROM THE PAST AND THE PANDEMIC
TO ADDRESS MENTAL HEALTH IN TRIBAL COMMUNITIES**

Heather Tanana¹

I. Introduction

The United States' response to the coronavirus pandemic has been widely criticized. The federal government failed to provide leadership and to fully appreciate the seriousness of the virus until it had reached all corners of the country. For many Americans, the lack of federal leadership may not have had a direct impact on their access to health care during this time. However, Tribal communities² generally rely on the federal government for their health care services. When COVID-19 hit, it is not surprising that it devastated Tribal communities. Based on past federal policies, American Indians and Alaska Natives suffer various health and socioeconomic disparities that make them not only more vulnerable to contracting COVID-19, but also more susceptible to negative outcomes once infected.

Much attention has focused on COVID-19 infection rates and related deaths in Indian country.³ The Navajo Nation experienced one of the highest infection rates in the country with 9,820 positive cases and 503 confirmed deaths.⁴ However, the pandemic's reach has gone beyond physical impacts on the body. COVID-19 has also affected the mental health of Tribal members and their access to mental health services.

This Article dives into the effects of the coronavirus pandemic on the mental health and general well-being of Tribal communities. Section II sets the stage by providing the history of federal and Tribal relations, followed by a summary of the current state of mental health in Indian country. Section III discusses the impacts of COVID-19 and the rise of telehealth to provide much needed mental health services during the pandemic. The article concludes by providing recommendations to continue the progress made to fill the historic gap in mental health services in Indian country post-pandemic.

II. A Look at the Past to Understand the Present

Federal policies have shaped the landscape in Indian country, leaving a lasting effect on the mental health and general well-being of Tribal communities. To fully understand the impacts of COVID-19, this section provides background on the federal policies affecting Tribes and their members, followed by a summary of the mental health issues facing Native Americans prior to the pandemic.

¹ Heather Tanana is an Assistant Research Professor and Wallace Stegner Center Fellow at the University of Utah's S.J. Quinney College of Law. She is also an Associate Faculty member at Johns Hopkins University's Bloomberg School of Public Health. She is a citizen of the Navajo Nation.

² In this article, the Indigenous populations of the United States are interchangeably referred to as American Indian and Alaska Natives (AI/AN), Native, Tribal, and Indian (the term largely used in federal law).

A. Federal Policies and the Perpetuation of Historical Trauma

The United States has a complex relationship with Native Americans that is defined by power disparity and unique historic legal arrangements. As the original inhabitants of this country, Tribes predate formation of the United States. In a series of cases known as the *Marshall* trilogy, the United States Supreme Court recognized Tribes' inherent sovereignty to govern their own people and land—while ensuring that Tribes remained subservient to the federal government. These cases established key (often competing) concepts and principles in federal Indian law—e.g., sovereignty, domestic dependent nations, and the trust relationship. Tribal sovereignty essentially is a Tribe's right to govern itself. And yet, Tribes are also domestic dependent nations, reliant upon the federal government for protection. As a result, a trust relationship exists between the federal government and Tribes. Comparisons have frequently been made to a relationship like that of a guardian and ward, or a trustee and beneficiary. The federal government has a duty to protect Tribal rights. Always hovering in the background is Congress' absolute right to extinguish any and all Tribal rights, including the very existence of Tribal nations in this country. However, “[u]nless and ‘until Congress acts, the tribes retain’ their historic sovereign authority.”⁵

The challenge of balancing the rights of Tribes against those of the federal government has an unbalanced history. At times, the federal government appears to have simply not wanted to go through the effort. The pervasive belief that Native Americans should adopt the white man's ways and be incorporated into the general U.S. population led to federal policies that had severe consequences on Tribes and their members, including the termination of Tribal status and cultural identity. Even when the federal government decided to allow Tribes to continue to exist, other federal policies—such as the Reservation Era—still had a negative impact on the general well-being and success of Native Americans. It was not until the most recent era—the Indian Self-Determination Era—that the federal government truly embraced Tribal existence and their inherent right to self-governance. Nonetheless, to this day, federal actions are frequently taken to undermine or disregard Tribal sovereignty.⁶

A basic understanding of the various federal policies is essential to understanding the current landscape in Indian country. Accordingly, a brief summary of the Indian federal policies is provided below:

Policy Era	Timeframe	Policy Goal
Removal Era	1835-1861	To provide Indians a place to live undisturbed where they could govern themselves and adjust to civilized ways.
Reservation Era	1861-1887	To open up land to white settlers and to domesticate Indians.
Allotment & Assimilation Era	1871-1928	To civilize and assimilate Indians into mainstream society.

⁵ *Michigan v. Bay Mills Indian Cmty.*, 572 U.S. 782, 788 (2014) (quoting *United States v. Wheeler*, 435 U.S. 313, 328 (1978)).

⁶ Carl Slater, *Lezmond Mitchell's Death Sentence Is an Affront to Navajo Sovereignty*, NY TIMES (Aug. 21, 2020).

Indian Reorganization Era	1928-1942	To promote “good” Indian culture, economic development, and self-determination, subject to approval of the federal government.
Termination Era	1943-1961	To end the special status of Tribes and the trust relationship between Tribes and the federal government.
Self-Determination and Self-Governance Era	1961-present	To recognize a government-to-government relationship between the federal government where Tribes are the primary driver of Indian policy through their exercise of inherent sovereign powers.

Other scholarship discusses the Indian federal policies in more detail.⁷ For purposes of this article, it is sufficient to understand that the federal government has not always been a friend to Tribes and at times has taken action directly contrary to Tribal sovereignty and the general well-being of Native Americans. Such actions have resulted in historical trauma that perseveres today.

Historical trauma is defined as “cumulative emotional and psychological wounding across generations, including the lifespan, which emanate from massive group trauma.”⁸ Historical trauma has been connected to depression, anxiety, suicidality, and substance abuse.⁹ Understanding historical trauma is essential when working with Native communities. And yet, it can be a challenging concept to fully grasp if you have not experienced it. To help illustrate this important concept, I often share pieces of my own family history and the influence past events experienced by my ancestors have had on my life:

My great grandmother was a small child when she and her family were forced to leave the only home she had ever known. They walked over 300 miles with the Army pushing them along with the point of a rifle in what is known today as the Long Walk. I never met my great grandmother. She had passed on to the afterlife long before I was born. And yet, I think of what she survived often. I imagine that she was confused and did not understand why their home and belongings were burned to the ground. I envision her with her head held high, attempting to mirror her own mother, and pretending to be brave despite the harsh sun blinding her eyes and blisters forming on her feet. Did her mother attempt to shield her from the dead bodies that seemed to increase in number each day? Or had they become accustomed to seeing death by then, something not to be spoken about in accordance with Diné culture?

My father was stolen from his mother. When the government agent showed up unannounced and took him, my grandmother did not know if she would ever see

⁷ See e.g., COHEN’S HANDBOOK OF FEDERAL INDIAN LAW § 1.

⁹ Maria Yellow Horse Brave Heart, et al. *Wicasa Was’aka: Restoring the Traditional Strength of American Indian Males*, 102 *American Journal of Public Health* 177 (2012).

my father again. My father was taken to a boarding school to be educated. Foreign words flew over his head. When he asked for help in the only language he knew, he was beaten. To this day, I tear up every time I think of how scared and alone he must have felt. I double check to make sure that I locked my doors so that no one will sneak in during the night to take my children.

I grew up in a safe home with two loving parents. I have experienced privilege in knowing that I would never go to bed hungry or lack a roof over my head. And yet, my heart aches for what my ancestors experienced. I feel anxious and cannot forget their pain. That is historical trauma.

My ancestors' experiences and the aftermath are not unique among Native people. In light of its widespread prevalence, those working with Tribal communities must acknowledge the continued existence of historical trauma and its impacts.

B. A Brief History of Mental Health and Health Services in Tribal Communities

“The disproportionate rates of mental and behavioral health issues faced by Native Americans have been attributed in part to the ongoing impact of historical trauma.”¹⁰ Native Americans suffer from high rates of alcohol and substance abuse, mental health disorders, suicide, violence, and behavior-related chronic diseases.¹¹ Native Americans experience serious psychological distress 2.5 times more than the general population.¹² Native youth have suicide death rates more than double that of non-Hispanic whites¹³ and also use and abuse alcohol and other drugs at younger ages and at higher rates than other groups.¹⁴ The life expectancy for Native Americans is 5.5 years less than the national average.¹⁵ Native elders are particularly vulnerable. Elders play a revered role in Tribal communities as the gatekeepers of traditional knowledge and culture. But research suggests that based upon the high prevalence of depression and dementia among Native elders, immediate action is required to avoid an epidemic.¹⁶ Legitimate concerns about elder abuse, neglect and maltreatment also prompted the Navajo Nation to pass the Dine Elder Protection Act.¹⁷

Stemming from treaty obligations, the federal government is primarily responsible for providing health services to Native Americans.¹⁸ This obligation has been interpreted to be a part of the federal government's trust responsibility to Tribes.¹⁹ Various federal laws have been passed that affect the general welfare of American Indians and health services received; however, a few have been instrumental in establishing the status quo and deserve to be noted: the Snyder Act, Indian Self-Determination and Education Assistance Act (ISDEEA), and Indian Health Care Improvement Act (IHCIA).²⁰

The Snyder Act of 1921 first authorized funds for “the relief of distress and conservation of health” of American Indians, including the employment of physicians.²¹ Originally, the Bureau of Indian Affairs, under the Department of Interior, was the responsible federal agency, but this role transferred to the Department of Health and Human Services and the Indian Health Service was created.²² The mission of IHS is “to raise the physical, mental, social, and spiritual health of American Indians and Alaska Natives to the highest level.”²³ The ISDEEA was enacted during the Self-Determination and Self-Governance Era. The Act allowed Tribes to enter into agreements with IHS to assume management of health-related programs and services.²⁴ Under such agreements—often referred to as a 638 compact or contract—Tribes are able to tailor programs and services to their community needs. The IHCIA, originally passed in 1976²⁵ and permanently reauthorized in 2010,²⁶ confirmed the federal government's responsibility to improve the health of Native Americans, allocated additional resources for health services, and established Urban Indian Health Programs. Today, the health care delivery system is known as the “I/T/U” system and refers to three different means of service: “I” for IHS; “T” for Tribal programs under the ISDEEA; and “U” for urban health centers. For many Native Americans, the I/T/U system is the only source of health care, including mental health services.²⁷

While the federal government has acknowledged its responsibility to provide health services, Congress has historically failed to appropriate sufficient funding to meet the health-related needs of Native Americans.²⁸ IHS health care expenditures are approximately 1/3 of those for federal health care spending nationwide.²⁹ “Indeed, when adjusted for inflation and population growth, the IHS budget has remained static in recent decades, with little additional funding available to target the chronic health disparities facing Native communities.”³⁰ To help

fill this funding shortfall, IHS has turned to third-party revenue by billing a patient's private insurance or the Centers for Medicare & Medicaid Services (CMS) when applicable.

Mental health services in particular lack infrastructure support.³¹ The IHS Mental Health program is a community-oriented and preventative service program that focuses on providing acute, crisis-oriented outpatient services.³² Over half of the mental health budget and associated programs are managed directly by Tribes under the ISDEEA.³³ Regardless of the delivery system—IHS or Tribally operated—health facilities serving Tribal communities often lack skilled and trained personnel, including psychiatrists and psychologists due to the remote location.³⁴ Due to their geographic isolation, it is also challenging to refer individuals from Tribal communities to resources located off reservations.

III. The Impact of COVID-19 on Tribal Communities and Response to Facilitate Mental Health Services

Before COVID-19 spread to Indian Country, Tribal communities faced significant challenges, including health and socioeconomic disparities.³⁵ For example, many tribal members lack running water and electricity. Additionally, many households are overcrowded, sharing a small amount of space with multiple generations. Further, the rhythms of life in many rural Tribal communities exacerbate potential transmission points. Tribal members often have to travel long distances to shop at the only grocery store available. Because going to the store is an event that takes several hours and provides social interaction, families often shop together. Add to this a lack of running water, and the risk of COVID transmission is counter-intuitively exacerbated by the remote landscape of Tribal communities. Finally, as discussed in more detail below, many Native Americans suffer from pre-existing conditions—like diabetes, hypertension, obesity, heart disease, alcoholism, asthma—that exacerbate the risks of contracting COVID. These existing conditions have a direct effect on the virus' impact in Tribal communities. This section discusses the impact of COVID-19 on Native Americans and the use of telehealth services to provide mental health services during the pandemic. It concludes with lessons learned and recommendations for after the pandemic ends.

A. COVID-19

The Center for Disease Control (CDC) recently released a report on the incidence of COVID-19 among Native Americans.³⁶ The CDC found the overall COVID-19 incidence rate among Native Indians to be 3.5 times higher than that of white persons.³⁷ The report noted that several factors play into this disparity. “Historical trauma and persisting racial inequity have

³⁷ *Id.* Notably, the CDC report likely underestimates the actual COVID-19 incidence among Native Americans based upon data limitations. *Id.*

contributed to disparities in health and socioeconomic factors between AI/AN and white populations that have adversely affected AI/AN communities; these factors likely contribute to the observed elevated incidence of COVID-19 among the AI/AN population.” Shared transportation, limited access to running water, household size, and other factors prevalent in Tribal communities also may facilitate COVID-19 community transmission.³⁸ Once infected, Native American adults have the highest risk of developing severe illness compared to other groups.³⁹ While data gaps exist, the current available data clearly shows that Tribal communities have been hit hard.⁴⁰

The full impact of COVID-19 on mental health is the subject of ongoing study and will not be known until after the pandemic ends. However, research has shown that large-scale disasters, whether traumatic, natural, or environmental, “are almost always accompanied by increases in depression, posttraumatic stress disorder (PTSD), substance use disorder, a broad range of other mental and behavioral disorders, domestic violence, and child abuse.”⁴¹ Social isolation, loneliness, and job loss—all consequences of the pandemic—have also been linked to poor mental health, including increased depression, anxiety, substance abuse and suicide.⁴²

Tribal communities are generally close knit with frequent opportunities for social interaction through traditional gatherings. While research is not yet available specific to American Indians and Alaska Natives, a Canadian survey sheds some light on the impact of social isolation within Indigenous communities. A survey in Canada showed that 60% of Indigenous respondents felt their mental health had worsened since the onset of the pandemic and social distancing measures.⁴³ Overall, the survey revealed higher proportions of Indigenous participants reported worsened mental health since the pandemic than non-Indigenous participants.⁴⁴ First Nations people in Canada share a similar history of colonization and systemic inequalities to Native Americans in the United States. Given the similarities, it is reasonable to assume that Native Americans’ mental health has also been disproportionately impacted during the pandemic.

B. Adapting to Address the Mental Health Needs of Tribes through Telehealth Services

Three actions have been suggested to address the increase in mental health conditions associated with the pandemic.⁴⁵ First, digital technologies should be used to bridge social distance and ameliorate loneliness.⁴⁶ Second, mechanisms for surveillance, reporting, and intervention should be implemented.⁴⁷ And, finally, stepped care should be provided by utilizing the most effective, least resource-heavy treatment first and then following with more resource-heavy treatment based on patients' needs.⁴⁸

Telehealth—the use of electronic communications for healthcare—can support all three of these protective measures. Outreach and screening for loneliness and associated mental health conditions can be conducted through telehealth services and existing reporting and intervention measures adopted. Mental health visits, group visits, and other care via technology platforms can also provide acute crisis management and routine communication and support.

There are three main types of telehealth services:

- (1) *Telehealth visits* provide services that generally occur in-person;
- (2) *Virtual check-ins* are brief communications with providers and their established patients to determine whether an office visit or other service is necessary; and
- (3) *E-visits* are communications between providers and their established patients through an online patient portal.⁴⁹

Shifts in federal policy have paved the way for use of telehealth in Indian country. Prior to the pandemic, telehealth visits were not reimbursed by CMS or private insurance companies at the same rate as in-person medical services and were generally limited to rural areas. This changed when the Secretary of Health and Human Services invoked Section 1135 of the Social Security Act and issued a blanket waiver.⁵⁰ The Coronavirus Aid, Relief, and Economic Security (CARES) Act further broadened HHS' authority to waive various CMS requirements in response to the pandemic.⁵¹ The primary purpose of the waiver was to allow patients to have access to physicians and other clinicians while staying at home under safety orders and to mitigate spread of the virus.⁵² Under the waiver, Medicare telehealth services are available to beneficiaries

⁴⁵ *The Mental Health Consequences*, supra note 40.

⁴⁶ *Id.*

⁴⁷ *Id.*

⁴⁸ *Id.*

⁴⁹ See Center for Medicare & Medicaid Services (CMS), *Medicare Telemedicine Health Care Provider Fact Sheet*, <https://www.cms.gov/newsroom/fact-sheets/medicare-telemedicine-health-care-provider-fact-sheet>.

⁵⁰ CMS, *Emergency Declaration Blanket Waivers for Healthcare Providers*, <https://www.cms.gov/files/document/summary-covid-19-emergency-declaration-waivers.pdf>. Blanket waivers may be issued during declared emergencies to ensure sufficient healthcare services are available to meet the needs of Medicare, Medicaid, and Child Health Insurance Program beneficiaries. These waivers generally terminate no later than the end of the emergency period. President Trump declared the coronavirus pandemic an emergency on March 13, 2020. Unless extended, the CMS waivers will terminate on January 31, 2020.

⁵¹ Pub. Law 116-136, §§ 3704-3719.

⁵² CMS, *Physicians and Other Clinicians: CMS Flexibilities to Fight COVID-19*, <https://www.cms.gov/files/document/covid-19-physicians-and-practitioners.pdf> [hereinafter *Physicians and Other Clinicians*].

regardless of where they are located.⁵³ CMS requires most telehealth services to be implemented using technology with audio and video capabilities for two-way, real-time interactive communication.⁵⁴ But, the waiver allows the use of audio-only equipment to provide certain services, including behavioral health counseling.⁵⁵ The waiver also allowed for a broader range of practitioners to use telehealth to provide Medicare services. All health care practitioners who are authorized to bill Medicare for their professional services may also furnish and bill for telehealth services and may do so from any location during the pandemic.⁵⁶ Many private insurers have followed suit to cover telehealth services during the pandemic.

The pandemic has created a unique opportunity to make advances in mental health service delivery in Tribal communities. Tribal communities historically have had limited access to care for behavioral health. Telehealth services present an opportunity to remedy this problem and should continue to be supported and developed. To do so, CMS' changes regarding telehealth services should be made permanent by Congressional action.

IHS must also be fully funded. IHS received a much needed surge of money from COVID-19 legislation packages. And while funds can be used to improve teleworking capabilities,⁵⁷ there are restrictions on how and when the funds can be used. Moreover, pre-pandemic, the IHS system was already overburdened and underfunded.⁵⁸ To fully fund IHS, an estimated \$32 billion is required.⁵⁹ Congress must appropriate sufficient funds to IHS to allow it to fulfill its mission and the federal government's treaty obligations.

IHS and Tribes should receive dedicated funding to build much needed infrastructure in Indian country. Greater infrastructure development is required to facilitate widespread implementation of telehealth services. Approximately 35 percent of Indian country residents lack access to broadband internet.⁶⁰ Growing attention to the lack of other utilities, such as public water systems and electricity, should be harnessed to develop a comprehensive infrastructure development plan in Indian country that includes greater access to cell phone and broadband services.

Finally, IHS and Tribally operated facilities should establish telehealth programs that incorporate the recruitment and training of mental health professionals to provide culturally appropriate telehealth services. Culturally competent care helps ensure that patients do not feel

alienated or disrespected; and therefore are more likely to comply with treatment.⁶¹ Telehealth programs should also work with the community to promote acceptance of technology and use of telehealth services.

IV. Conclusion

Prior to the coronavirus pandemic, Native Americans suffered health, social, and economic disparities that in large part are a result of past federal policies and broken promises. When COVID-19 spread to Tribal communities, these disparities exacerbated the spread and severity of the virus in Tribal communities. Unsurprisingly, the data demonstrates that Tribal communities have been hit almost three times as hard as other communities. Though not yet thoroughly documented, this will also have a toll on mental health. While many will not come out of the pandemic untouched, the pandemic has brought attention to the challenges Tribal communities face and provided a unique opportunity to address some of the historical inequities that exist. The expansion of telehealth services has offered one solution to providing greater access to mental health services in Tribal communities. We should continue to build off progress made during the pandemic to fully implement telehealth services permanently in Indian country.

⁶¹
